Don,

You can get these sheets from Techniks, Inc. Phone: (908) 788-8249.

A word of warning though from a previous user....

I've used this method in the past to make boards and have had only OK results. If you're doing rather simple and straightforward boards with standard leaded components you may be OK. If you're doing surface mount work my advice is to forget it. If you do not heat the film and board uniformly during the transfer process pad areas will not adhere properly. For small surface mount pads this can spell disaster. Larger thru-hole pads and tracks can be "doctored up" with a resist pen to cover up weak spots. Running the sheet thru the copier (to transfer the toner) produces slight optical distortions in the image so sizes of pads and tracks are slightly altered. Also, heat causes the film to distort slightly so registration of a large board is almost always off. A large board will have trouble getting mounting holes (at the board's corners) to line up properly.

Actualy, I got so tired of trying to make PC boards with crude methods (resist pens, heat transfer sheets, etc.) that I started my own company and now offer custom circuit board fabrication for hobbyists and hams!

Good luck with your project.

Mark

3529. FS Roller Inductors High quality

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-14 00:00:00 UTC
From: Chris <ck5@ix.netcom.com>
Message-ID: <36242788.4B@ix.netcom.com>
Source record: 78059
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,rec.radio.swap

I have two roller inductors. Both Porcelain. One is a very large unit capable of handling very large power. The roller is 9.5" long and 3.5" wide, it has about 80 turns of wire. The contact rides on a glass rod. Very smooth turning, and in excellent condition. It will handle from broadcast band all the way up past 30MHz. This would be great for a large amp or a large antenna tuner. $175 shipped.
The second Roller is much smaller but equally the same quality. The roller measures 4" long by 2" wide with 24 turns of wire. This would be great for a smaller tuner or transmitter up to a KW+. $75. Both these roller inductors are in excellent shape. I just changed my mind on the project I was working on. 73 Chris VE3NGW/W4 Florida

3530. Looking for Eimac 3-500Z data sheets

Newsgroup: rec.radio.amateur.homebrew

From: "Leland C. Scott" <no-spam@junk-mail.net>
Message-ID: <7018fr$ot6@nnrp2.farm.idt.net>
Source record: 78060

Does anyone have a set of scanned data sheets for the Eimac 3-500Z triode? I would really like to get the performance curves for this tube. If anyone has the data sheets can they post it in this ng?

Thanks

Leland C. Scott

> powered MMICs?

There are some GaAs parts intended for cell-phone use, but they're not
exactly practical for VHF high-band operation. Even the MSA-1023 isn't
terribly practical at 150MHz; it is very expensive and really intended
for developing power at 1GHz+, in a push-pull configuration as you note.

Beware of trying to build a single stage amplifier with high gain
and relative high power output. Practically speaking, they can be
rather unstable and much more trouble than a couple of stages of
lower gain, etc.

+27dBm at 150MHz is still most easily developed using a boring old
silicon bipolar transistor, like the (still available) 2N4427. Sure,
they're not quite as easy to use as the MMICs are in theory, but
it isn't that hard to build a 1W VHF PA with a handful of hand-wound
inductors and capacitors. Not trivial, but not that hard, and
considerably less expensive. I recall the MSA-1023 being *very*
expensive a few years ago, something $30 or more, a pair would run
over $50. A +30dBm (1W) PA built using a 2N4427 would be more like
$3 in parts; you might even be able to get enough stable gain by running
a little forward bias using the silicon diode trick (I've seen it done).

Good luck!

I have seen some diagrams for the MAR-x series MMICs (with similar or
equivalent models in the MSA series) in which the MMIC is simply a
Darlington transistor with some internal feedback resistors to bring
the input and output impedance to 50 ohms and tame the LF gain. Are
these devices really this simple ? Hmm, what about building building
general purpose broadband gain blocks using discrete transistors in a
similar configuration ?

Does anyone have the criteria for what capacitor to use for what application? There is polystyrene, polyester, polypropylene, metallized polyester, ceramic, mylar, silver mica, etc. How do you know which to use? Are some better for audio and some better for RF. Is the difference a matter of cost, temp stability, and quality between a couple of them? I build alot of homebrew projects and have never been able to get this straight. I would appreciate if someone could give some guidlines.

thanks

3541. Amateur radio TUBES F.S.(updated 10/14/98)

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-14 00:00:00 UTC
From: tubecntral@aol.com
Message-ID: <19981014094244.27708.00000543@ng-fd1.aol.com>
Source record: 78071

Hello, I have the following Amateur radio tubes for sale. All are NOS
in the original box unless stated otherwise. When possible, (some tubes
can only be tested in curcuit) tubes are tested with a Hickok TV-7D/U.
I have a vast amount of tested, miniature tubes for your recievers,
transmitters, test equipment, etc. at very reasonable prices. Also have
a pretty huge stock of all types of NOS tubes, please inquire about things
not appearing on any of my posts. I'm in the midst of learning how to
set up a website, perhaps in this life :o)... Shipping extra, runs only
3.00 and up, whatever the post office charges...insurance is only a buck
or so, depending on the market value for the particular item(s).
The large transmitter tubes have been checked via ohmmeter.
I will only shipped these fully insured.
Of course, i'll guarantee them to work properly, so PLEASE TEST CAREFULLY
IMMEDIATELY apon arrival, and if it doesn't do what you like, just send it
back right away for a prompt refund,(in original,shipped condition) less return

shipping charges. If defective, I'll absorb initial shipping costs.
Thanks,
if interested, drop me a line... 73's
Joe Pratt, Tubecntral@aol.com

The November '97 QST had plans for a MMIC preamp. Maybe this will make the next Handbook -- after all, the technology is now more than 15 years old.

Another netizen has already asked me to scan the plans and put them online, but I'm a little reluctant, because of copyright reasons.

I think the ARRL should put a few schematics on its web site -- but what do I know? I'm only an ARRL member and ham hobbyist, not an imperial potentate of a mega-publishing company.

Is it in the vertical section, or the high voltage divider section? To get any real help, you probably should give a little more info, like what the resistor is connected to, its value, etc. For example, something like: "It is the 10K plate resistor on the final vertical amplifier which drives the vert. deflection plates". The model of the scope might be a good idea, since someone may have that model and had the same problem.

Also, there is a Heathkit mail reflector where you can go to get help if you cant find it anywhere else. Lots of people who have lots of different heath stuff.

3553. 28Mhz PIN Diode Switch???

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-14 00:00:00 UTC
From: Bruce Richardson <w9fzw9fz@ix.netcom.com>
Message-ID: <36250781.760ACBCB@ix.netcom.com>
Source record: 78083

I have all the Microwave Updates and CSVHF proceedings. I've been looking for a 28 Meg PIN diode switch to clone. So I looked at the 2m PIN switch on page 345 of the '91 MU proceedings. Nice article and I used the equations to come up with some new values for 28 Meg.

I've built it up and it seems to attenuate a lot :-) I need to take my dip meter to it to check it--haven't done that yet.

Looking for suggestions on circuits to try. Any guesses as to why their is an absense of cut-and-paste instructions (in the standard books) to follow for a 28Mhz PIN diode switch? Is it that scaling the 2m design is so darn easy? Or is it that PC relays offer enough isolation at 28 Megs? I have a spare set of contacts on the switching relay that I could use for RF if that is what most folks do at 28 megs.

I've built up Zack Lau's 222-28 transverter from the QEX article and it is time to integrate it into a system. I know the thinking with PIN diode switches is that an expensive coaxial relay is replaced by this cheaper method and get adequate isolation with the power levels involved. I will use a coaxial relay on the power output end because of the power levels involved.

Thanks for your inputs. If you email me direct, just cut the "name" in half.

MMIC amplifiers aren't rocket science. I recall that the Mini-Circuits
adds usually include a generic schematic, and I know the HP databook
contains a great deal of detail. Essentially, MMICs are have input
and outputs coupled through a DC-blocking capacitor and a voltage-dropping
resistor from the output pin to a regulated, decoupled DC supply.

Have a look at Mini-Circuits online catalog http://www.minicircuits.com/
for an example application schematic (in monolithic surface-mount page 2);
it is usable as-is, unlike many sample application circuits.

We are less than 30 days away from the Odessa Texas 15th Annual Hamfest!

If you haven't been here, don't miss this year! Lots of prizes, hidden transmitter hunts, lots of door prizes, lots of fun. We fill 21,600sq ft of space with over 200 tables of vendors & hams. Yes, we are not the largest fest around.... But, we like to think it's a fun and great fest. Ask any of the dealers that have been attending for years.
Texas Bugcatcher
The Ham Store (KCOMM)
WB0W
Rad-Com Radio
and many more...

This year is the first year we have had online & secure registration. No, you do not need to attend to be eligible for the major prize drawings on Sunday. And, any unclaimed registrations are put into the hopper prior to the major drawings on Sunday. Hey! Come check out the Sunday Lunch/BBQ!
Prizes include:
Alinco DX-70T
ICOM 2710
ICOM T7A
ICOM T2A
ICOM T2A (yes, two of them)
ALINCO C1T (2 of them)
ALINCO C4T (2 of them)
COMET GP-6
And...possibly a full computer w/monitor...still working on this prize.

Derf Henderson (fahenderson@fedex.com) wrote:
: Does anyone have the criteria for what capacitor to use for what
: application? There is polystyrene, polyester, polypropylene, metallized
: polyester, ceramic, mylar, silver mica, etc. How do you know which to
: use? Are some better for audio and some better for RF. Is the
: difference a matter of cost, temp stability, and quality between a
: couple of them? I build alot of homebrew projects and have never been
: able to get this straight. I would appreciate if someone could give some
: guidlines.

There are so many different kinds because each kind has characterisitics
that make it valuable in some applications. It's hard to nail everything
down, but here are just a few guidelines that might help:

polystyrene: stable, low dielectric absorption, low distortion and high Q,
but limited temperature range. Not generally very available new.
Polyester: same as Mylar. Almost all would be metalized, I think.
Good compromise for small size and low cost and reasonable audio
distortion performance. Useful to very low RF frequencies.
Polypropylene: Larger and higher cost than polyester, but lower
dielectric absorption and lower distortion. I've measured distortion
below -140dBc using polyprop caps in a single pole HP filter at its
cutoff freq. Polyester is maybe 20dB worse, still very good. Ceramics
can be much worse! Because of good dielectric absorption, polyprops are
good for pretty accurate integrators.
Ceramic: two main kinds: temp-stable and "high-K". The temp-stable
seem comparable with polyester for dielectric absorption and distortion,
and the high-K type are much worse. The high-K also can generate
significant low freq noise when biased! Ceramics are generally very
good for RF bypassing, because they are available with extremely short
leads and low series inductance. The temp-stable kind can be among the
best for low temp coefficient, and also are available in specific
temp coeffs.
Silver mica: larger than temp-stable ceramics generally. Do well at
RF for filtering and coupling. In some constructions, can handle a
lot of RF current. (Note: capacitors heat when AC current flows thru
them, and that limits how much current they can handle.)
Electrolytic: Aluminum and tantalum. Useful for energy storage, like
power supply filters and low-frequency bypassing on power supply lines
in circuits. Very temperature un-stable, and very high dielectric
absorption. Tantalums can be effective for bypassing frequencies up
to perhaps 1MHz.

People write whole books on capacitors...this is an extremely condensed
set of comments, and perhaps not even the most important things about

each type. Have a look in some books. I know that "Reference Data for Radio Engineers" has a pretty good discussion of caps, and I'd be really surprised if "The Art of Electronics" didn't have, too.

I have 8 MSA1023's for sale. The price is $15 plus shipping ea. A single one of these 25ohm mmic's should give you around 500mW. They can be used single ended with a 2:1 SWR or with a transformer. Or in push pull using a transformer or narrowband balun (coax).

I also have some Motorola MHW8242 Hybrids (pdf available at mot.com). These hybrids will do at least 500 mW from about 10 MHz to 1.3GHz. The units I have are brand new and come from a high frequency batch. If I recall correctly they have over 23dB of gain from 20 to 1.3GHz. They do over 1/2 a watt everywhere. Price is $20 each. They opperate from 24V, but still do power when used at 13.8V.If interested please email me at:

N4IPieter
mickeymouseic@ibelings.com

3561. 500mW++ Hybrids FS 10 to 1.4GHz 24dB gain

Newsgroup: rec.radio.amateur.homebrew

Source record: 78091

I have a couple of 24dB gain hybrids for sale. These are higher frequency batches of the Motorola MHW8242A (Pdf available from mot.com). They run on 24 volts and have 24 dB gain. P1dB is around 700mW flat from 20MHz to 1300+GHz with about 4dBm drive. Price is $20 each or 2 for $30 shipped US48. Hybrids are new. Hybrids have over 20dB return loss at 75ohms which is around 1.5 swr at 50 ohms. They work real well for experiments.

Hi Guys, got some good stuff here that I no longer have the room for...
:)

e-mail direct if interested.

Homebrew RF-Deck uses pair 4-125's, about 500W out needs HV supply:
$150.00
(The parts in this thing alone are worth $150.00)

Unbuilt Heathkit 5-Position Rotary Coax-Switch $50.00

Heathkit DX-60B w/matching HG-10 VFO: $120.00

MFJ 752C Signal Enhancer: $30.00

Heathkit AM-2 Swr Meter: $10.00

Pair Collis Motorized Roller Inductors $75.00

Kenwood TS-930SAT w/250hz CW filter, auto tuner, etc... exec condition:
$850.00

Linear Amp Parts (sold as set, will not split): Pair of 4CX1500B medical
pulls, w/1-Socket/Chimney,
Peter W. Dahl Plate transformer a 115/230 VAC primary and a 1250 VAC @
1.5A CCS secondary
8-1500mfd @ 450V Computer Grade caps, pair of 6KV block diodes,
pair of ducted blower fans (pulls from military equipment) all for $425.

3568. Reliable R/C transmitter..

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-15 00:00:00 UTC
From: heckers@mail.suntrix.com
Message-ID: <36270a4a.2634612@news.suntrix.com>
Source record: 78007

Hi, I am designing a simple R/C transmitter circuit. The idea I had in mind was to generate a 25 MHz carrier and pulse this on and off at about 40 KHz. The receiver would then receive the 25 MHz carrier and look for the 40 KHz modulation frequency. I suppose I could just send the unmodulated 25 MHz carrier, but then the receiver would be more prone to background RF noise.

I was thinking of using a NE602 mixer with a +1v - 0v 40 KHz sqare wave on one of its inputs and applying the 25 MHz carrier to the other input. This should work, but is there an easier way? Could I just turn the carrier oscillator on and off at 40 KHz? Since the carrier oscillator will be crystal controlled, wouldn't it take too long to stabilize?

Thanks for any info,
Shawn

3572. Help - Add on squelch circuit

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-15 00:00:00 UTC
From: GarthKH@intekom.co.za
Message-ID: <7054ue$o3t$1@news2.saix.net>
Source record: 78011

Does anyone have a circuit for a squelch circuirt that can be added to
a conventional FM radio receiver?
I have a radio microphone and this works fine across to the FM radio
but if I turn the mic off to save the batteries the receiver goes into
a load hiss.

Thanks
Garth ZS5QP

There are several canned solutions that do the same thing...

Micrel has a receiver on a chip for on/off keyed remote control.
http://www.micrel.com/qwikradio.html

Linx Technologies has complete receiver and transmitter modules in
several different varieties that require no external components other
than an antenna and data source. http://www.linxtechnologies.com

3574. build your own coax switch for fun and ... well, just fun.

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-15 00:00:00 UTC
From: nicholas charles caruso <caruson@certco.com>
Message-ID: <36262C17.122E9854@certco.com>
Source record: 78013
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.shortwave

OK. I got a nice four-position ceramic rotary switch, silver contacts, multiple wafers, 2 poles per wafer.
(Electronics Surplus Store in Manchester, NH, is a *great* place)
I've got a suitably sized cast aluminum enclosure, and a bunch of so-239 bulkhead mount connectors.
I know about keeping RF wiring as short and direct as possible.

I'm planning on building an antenna switch for a shortwave receiver -- so power handling won't be an issue.
But, just in case, can I estimate the maximum power handling capability of the switches? The ceramic wafers are pretty heavy duty, but the contact spacing is fairly close, and the contacts themselves are fairly flimsy looking.

Are there any gotchas that I should be aware of? Should I use rg-174 (or 58) inside the enclosure?

Any advice would be appreciated,

thanks and 73,
nick caruso kb1dej

Great! Thanks for that pointer! I have a lot of respect for what Walt Jung writes. It does emphasize the audio aspects of caps, though, and something similar must exist on the web for the RF aspects. There are somewhat different requirements.

The monolythic ceramics are made from the same dielectrics as the "simple" ceramics, AFAIK. That means they will generally behave the same. They are typically smaller, though, and have lower inductance by virtue of having their plates connected in parallel at each end. Surface mount capacitor chips can have self-resonant frequencies up in the many-GHz region. (I've seen up to 20GHz or so, I think...though that's beyond what I deal with by a good bit.) But that's for small values as well as small sizes. "0603" size and even "0402" size is common now for surface mount: that's roughly 0.060"x0.030" or 1.5mm x 0.76mm for the 0603. If you can learn to work with these things (and similarly small active parts and tight-spaced circuit boards), you can build circuits that work quite well up to a GHz and perhaps beyond. How things have changed since I got my novice license!

Selling Eddystone EC10 receiver

The Eddystone EC10 is a single conversion transistorised communications receiver covering 550 kHz to 30 MHz in 5 bands. Made in the 60's. Mainly bought these days by collectors. I think the EC10 may have been the first transistorised communications receiver made by Eddystone Radio Ltd.

In working order with photo copy of manual and schematic.

Offers please

John G3UGY

Ceramic wafer switches are typically 3 to 5 A per contact, but we don't know
what you have, so---
If the leads are less than 2-3", just use #18 bare from the SO-259 to the
switch. It is desireable to short the unused antennas to ground or at least
terminate them. You may be able to do that with the extra decks of the switch.

I'm not an expert on internal construction of MMICs, but my understanding
is that they are indeed that simple internally. However, a big part of
the simplicity is that they're monolithic and thus essentially avoid issues
with inherent/parasitic reactances. For example, a major advantage of the
MMIC is the extremely low emitter reactances; even a teeny (that's a technical
term) bit of series inductance in the emitter can severely hurt the broadband
behavior of a transistor. Trying to realize the same circuit with discretes
will rapidly encounter these issues.

Hayward's text _Introduction to RF Design_, available from the ARRL, has
a pretty good relevent discussion.

I have some problem to figure out where to get an high voltage
transformer of 2.500 V and 0.5-1 A. Then i figure out that the microwave
oven also use a kind of tube with high voltage and around this walues.
Is there some out there that have tried this and did succeed?

Please replay direct to:

You could buy yourself a Communications Specialist
CTCSS board or you could build a simple tone encoder
using a pll chip...look in an older ARRL book
in the "Repeaters" section.
No direct help, I know but perhaps something
for you to go on.

Cheers, Hugh VA3TO

3593. 88ft dual antenna

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-16 00:00:00 UTC
From: Freeland <Freeland@chickasaw.com>
Message-ID: <aMNV1.41$WN2.1023542@news.goodnet.com>
Source record: 77949

Hello, I'm looking for a trap
to put in 88 ft dual antenna
which will resonate, recieve
and transmit between 1.8 and
148 mhz. The antenna looks
like
this; ------------+++---------

--------------+--------
----
top is where trap goes, bottom
is where transmission line is
connected, Ends are shorted
together. Am I doing this
right? This is all the space I
have. Thanks, maybe you
antenna gurus can solve this
problem, maybe I can build the
trap myself. The antenna
recieves well, but I'm
planning on connecting all my
transmitters to it on
2-meters, 10 meters, 40
meters, 20, meters, 80 meters.
I think the #22 wire will hold
up to 100 watts. Anybody
interested in solving this?

3594. TEAC 3300 Schematic

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-16 00:00:00 UTC
From: robin@teleplex.net
Message-ID: <362cb5dd.31334181@news.teleplex.net>
Source record: 77950

Need a valid schematic and any pointers anyone has to offer.

I have a TEAC 3300 not a TEAC 3300S. Difference is 3 relays vs 7
relays and the 3300 has no remote / time input nor does it have a
remote control plug either.

Problem : When in REC or PLAY the feed and takeup reels do not turn.
The FF and FR both work.

K2 is a DPDT AC Relay that applies power to the Captsain.
K1 is a 4PDT relay that will not pull in at all.
And the Last Relay is K401 that is use to set the machine RECORD
funtction in operation.

I cannot get K2 to work at all. It does not pull in at all nor do not
know the require voltage nor where this is supplied from. I suspect
that this is the relay in question.

There are no other relays in the machine.

The machine will go into High Speed Wind and Rewind and go thru all
other functions with out problems. However the motors will not go
into low tension take up and feed when play /record is pressed but the
captsian motor runs just fine.

Need a schematic badly for this machine. I was given a TEAC 3300S
schematic but this will not work. This machine has over 7 relays in
it and as you can see my machine has only 3 relays. Is there any help
out there in cyberspace??

Peter,

YIG filters are only useable above 1GHz. And that probably
puts a damper on your plans right there. But plowing ahead,
I have seen a few surplus units for sale recently for
around $100. They generally tune from 1GHz to 18GHz.
Don't know how many poles, but I would think 3 is the min.
I have got them for as low as $50. But, that takes time.

I've never seen a kit. e-mail me if you want one.
I don't have any spares right now, but run into them
fairly often.

regards,
Steve

Jim,

Funny you should ask as I was just researching this issue for my
employer to see how long a new instrument would last on Alkaline
batteries. Turns out that Duracell:

http://www.duracell.com

Has the PDF datasheets for each of their batteries online.
Look in the OEM section of thier web page.
Also Energizer:

http://www.energizer.com

did not have thier datasheets posted but the bunny emailed me
the pdf files on request. If you are interested and have
trouble with them, I can forward the files to you.

9V batts in series for B battery service works
great.

Interesting story: I always remember a buddy of mine as a
kid used to test 9V batteries by sticking them on his tongue.
Well one day he came into my garage and picked up a 67.5V
B battery (which looks like a giant 9V battery) and tested
it as usual! Threw him clear to the other side of the room.
:)

Have fun and use a DVM to test your batteries.

Steve M.

3600. SST RIT circuit needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-16 00:00:00 UTC
From: Willie Garis <willieg@scinetinc.com>
Message-ID: <3627DC69.70504CD1@scinetinc.com>
Source record: 77956

I have one of those fantastic 'lil QRP rigs from Wilderness Radio
called the SST. Love the performance and size of it, but it has no
RIT, and in conjunction with the very sharp audio filter, its
tough to talk to another station that may be a few hertz off ...
I change a bit to hear them better, then they readjust when I send,
instead of using *their* RIT (arrgh!) ... so I end up chasing the
freq a bit or just trying to copy them at an uncomfortable pitch.

Has anyone seen a mod to add a RIT feature to this gem? I've looked at
the
circuit and can thin k of a way to offset the varactor diode that runs
the
LO, but just thought I'd see if the wheel has already been invented.

TIA

I don't have it handy, but I'm pretty sure the Avantek catalog lists
several that cover down to 500 MHz.

The prices are unlisted, but you can bet they're in the "if you have to
ask, don't bother asking" category.

3602. FS Roller Inductors High quality

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-16 00:00:00 UTC
From: Chris <ck5@ix.netcom.com>
Message-ID: <3627E6D4.16E8@ix.netcom.com>
Source record: 77958
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,rec.radio.swap

I have two roller inductors. Both Porcelain. One is a very large unit capable of handling very large power. The roller is 9.5" long and 3.5" wide, it has about 80 turns of wire. The contact rides on a glass rod. Very smooth turning, and in excellent condition. It will handle from broadcast band all the way up past 30MHz. This would be great for a large amp or a large antenna tuner. $150 shipped.
The second Roller is much smaller but equally the same quality. The roller measures 4" long by 2" wide with 24 turns of wire. This would be great for a smaller tuner or transmitter up to a KW+. $65. Both these roller inductors are in excellent shape. I just changed my mind on the project I was working on. 73 Chris VE3NGW/W4 Florida

I have a power supply that uses microwave oven transformers as well as
capacitors, rectifiers, relays and other parts from these appliances.
It's
described in the Jan/Feb 1998 issue of QEX. I use it to power an HF
amplifier.
They seem to work well enough if you remove the magnetic shunts. They
are
are generally used in pairs. Although I don't have large enough filter
capacitorS (yet) to use it at its full rating, I have tested the output
at
2600 volts and 1 amp. It uses four transformers. The article explains
how
remove the shunts and wire the power supply. 73

RG174 is only for receivers (max 30W on HF). Worst problem with coax
swittches is crosstalk between different inputs, all screens going to a
switch must be tied together, but not necessarily ground at this point.
To tie them to ground may increase cross-talk, use only ground on the
coax connectors. For receivers I prefer BNC connectors.

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

3610. Battery Handbook Availability

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-16 00:00:00 UTC
From: Xjshillw6ivw@earthlink.net
Message-ID: <3626d7a2.21034381@news.earthlink.net>
Source record: 78034

Are battery handbooks still available? I have an old-time Burgess handbook that gave current vs time curves for various end point voltages, but it doesn't cover later batteries. I'm thinking of making a B-battery pack using 9-volt alkaline batteries to operate antique radios when on camping trips, but need some idea of battery life before buying them. Maybe I need a different battery.
thanks, Jim

3611. Pre-emphasis needed?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-16 00:00:00 UTC
From: leeleduc@pacbell.net
Message-ID: <3626bf55.726340@news.pacbell.net>
Source record: 78035

I'm building a Fox for 6M and 2M. I'm doing the old varactor modulated XTAL and multiplying it up to the desired frequency. Do I need to add pre-emphasis to my audio chain as you do for FM broadcasting? It's been awhile since I've done this and I don't recall if it's needed or not (I don't think its used with NBFM).

Thanks.

If I low-pass filtered the 40KHz square wave (i.e. convert it to a
sine wave) and fed that into the mixer instead, would that eliminate
the interference? Doing that would seem to produce a normal, full
carrier amplitude modulated signal. The reason I originally chose to
use the square wave was that I remember reading in the ARRL handbook
that one of the mixer's inputs (LO?) is typically driven with a square
wave. Now that I think about it though, and as you pointed out, this
would seem to produce an infinite amount of harmonics in both
directions of the carrier.

3616. Re: Which Capacitor to use for WHAT??

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-16 00:00:00 UTC
From: jeroen@rsplus02.cern.ch
Message-ID: <707h9ehom1@sunnews.cern.ch>
Source record: 78040

Two add my $0.02 to the discussion, here are some measurement results
of a few electrolytic and ceramic chip (1206 size) capacitors.

First tantalum 'drop' type capacitors: Values of 3.3uF and higher
have ESR values below 300 mOhm. Lower values have higher ESR,
rising well above 1 Ohm for values of 1uF and less. The ESR also
depends somewhat on frequency, dropping at about 3dB/decade in the
band where it is the dominating component of the impedance. (Which
is about 100k..20MHz, depending on the specific value.)
All Ta drops have ESL values of roughly 3nH, so that the (inductive)
impedance rises above 1 Ohm at 50 MHz for almost all of them.

Note that this 3nH value is measured directly at the capacitor body
and mounting the cap on 5mm legs just about doubles the ESL. Also,
the inductance of the PCB track + IC pin between the capacitor and
the chip is often the dominating impedance in RF bypass jobs.

Radial lead aluminium caps of 100uF or greater have ESR below 100
mOhm, practically independent of frequency. The ESR has a negative
temperature dependence of about 2%/degree Celsius. Smaller values
again have higher ESR: E.g. 47uF - 0.6 Ohm.
The ESL depends on lead spacing, about 4nH for 2.5mm and 7nH for
5mm. So, contrary to common wisdom, these caps are practically as
good as Ta caps for RF bypassing jobs, and a good deal cheaper.

Axial lead aluminium capacitors have about the same ESR values as
the radial leaded ones, but the ESL is evidenty higher and a direct
function of size. About 10nH for a capacitor with 17mm body length.
One 100uF-25V cap even had the anomalous ESL of 88nH, despite its
10mm length.

Finally, ceramic 1206-size SMD capacitors all have an ESL of 0.9nH,
which is about the same as a 2mm piece of 0.5mm diameter wire.

I've got 6 Eimac 304TL's that appear tobe NOS, 2 are in
original boxes and the other four are still wrapped in the
original paper but the boxes have deteriorated..they've been
in a dry attic for many
years.
I also have 2 Amperex brass base 211's, condition not
known
but filament continuity OK. I have no way to test further,
they dolook good.
I'll sell the 304TL's for $150 and the 211's for $50,
shipped if you take all.

In the Amidon catalog there are some cores with the same material
and same diameters with differing heights (thicknesses?). I believe
their suggestion is that, yes, the Al is proportional to the
core height. Should be easy to verify on your bench!

Coincidentally there was just a report on TV about batteries. Consumer Reports says their tests show a 10-20% difference between brands and recommend that if the price exceeds that to buy the cheaper alkaline battery ... in fact they found that the cheapest GE Sanyo alkaline lasted the longest!

It would be interesting to stack the Radio Shack NiMH rechargeable 9v battery up against the rechargeable 9v alkaline and Nicads.

I would like to reply to the BYO Intelligent AR Tranceiver note:
The book is one of the most interesting, well written, easy to understand discussions of a modern transceiver I have seen. However, it points out how much I DO NOT know about digital electronics. I enjoyed reading the book just for the fun of it.
I would like to build the xceiver however I believe it is beyond my ability. As well laid out the book is and with the ample explianations given for each phase of construction, I think the project would be a bit more than I can take. I have other commitments, haveing just moved across the country and still don't have my tower and beam up yet. First things first!
Several comments about the book: How come Randy doesn't include his call sign? Also, I think the specifications of the xceiver should have been included somewhere in the book. This posting is the first time the output of 50 watts was mentioned. It seemed very strange to me to read the suggestion of using number three welding cable for a power feed for a 50 watt rig. I still wonder about this.
Anyhow, if anyone else is building the xceiver, I would be glad to look over their shoulder and see how it works out.
P.S. I have an extra mayonaise lid if anyone needs one. (I don't care for MIRACLE WHIP. 73 AND GOOD LUCK BUD WASSER K7TFY

>
> "The silicon diode trick"? One magician to another, how's it done?

A silicon diode is used to develop a bias voltage which closely
tracks the B-E junction temperature coefficient. Usually, this is
in a case where the power transistor (say, 2N4427) is operated
common-emitter (DC ground) and the diode is soldered directly to
the transistor for good thermal coupling. A trimpot is used to
forward-bias the diode, and a low-Q choke is used to couple the
bias to the base. The trimpot is adjusted for desired quiescent
current (class-AB1 bias, I believe, probably something like 10-20mA
is adequate for a 2N4427).

That's how the tune goes. Does it sound familiar? ;-)

Dave and Steve: Thanks for your responses.
Have not seen Sanyo batteries for sale, but my favorite location to purchase batteries is Home Depot. Be sure to look for the box with the greatest quantity of batteries. My local store in Torrance, CA (near Los Angeles) lists the per battery price, too. Think 9 V Alkalines were $1.67 each. Prices for D-cells were better than Sears batteries on sale.

Years ago, I bought some Radio Shack D-cells and put them in series with some normal brand (Burgess, Eveready ??). After the voltage dropped too much, I measured the voltage of each cell. The Radio Shack batteries were real dogs....

The 9-V batteries have power. My initial battery pack had a number of binding posts in line. They were too close together, and I had shorting problems. 5 9-volt batteries in series made a nice little arc. I learned my lesson, and replaced the binding posts with a receptacle, and now I plug in my Radiola III or Aeriola Sr. My SW-3 requires 135V, so needed to do a little battery research, first.

Microwave ovens are not pulsed like radar. The only "pulsing" is that
the suppyl is half-wave rectified so the magnetron conducts only on the
positive half of the AC cycle.

Most domestic microwave ovens are rated to run continuously at full
power for at least an hour (usually limited by the timer, not the RF
hardware). The transformer will be darned hot by that time, but is
designed to take it - especially if fan-cooled.

Almost any amateur radio service will be far more intermittent than
that.

The main problems with those transformers seem to be associated with the
fact that they're designed to run current-limited into a high voltage /
low current load. I'm looking forward to seeing the QEX article.

Source record: 77973

At a recent fleamarket in the Netherlands I bought the following
Philips RF power modules
Model BGY80 and Model ON4749 both made in the Philippines.

Both parts have identical dimensions and have 7 (gold plated) pins
for PCB mounting
The parts are packed in a green plastic sealed enclosure 26 x 13 x 8
millimetres moulded to a heatsink with
2x2 holes (in different plains) Dimensions heatsink : 35 x 10 x 7
millimetres.

Would much appreciate help with identification and pin designation.

> battery ... in fact they found that the cheapest GE Sanyo alkaline lasted
> the longest!

I saw that report last night too. Had my hip boots on! First off, they were compairing some pretty major brands - not the no-name discount drug strore brands. They were also testing them with kids toys - not a very critical application. If, for example, you were using the batteries to power a wireless mike for a major TV production you might not want to count on drug store brand discount batteries. Even 10 to 20% difference might be significant.

Except that if you saw the entire report the name brand manufacturers admitted that many of the store brands were the same as their much higher priced brand name batteries. BTW: It was the TV folk who tested with toys, not Consumer Reports.

Still would like to see more information about and comparisons between rechargeable alkalines, Nicads, NiMH and Lithium Ion. 73, DavidC AA1FA

3641. Helping Kids understand what's inside Computers and Technology

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-17 00:00:00 UTC
From: Terry King <tking@together.net>
Message-ID: <VA.0000035a.004538cf@together.net>
Source record: 77981

Hey, you guys know a lot, and are used to helping / teaching kids. Try this:

COMPUTER DEMOLITION -- PARPORT SOFTWARE -- BITS&BYTES -- ALARMCLOCK2000 --

We would like to announce the availability of new / updated materials for use by schools, educators and hobbyists in learning about computers and electronics:

We keep wondering:

"Will American kids be Inventors in 10 years, or just operate appliances designed elsewhere?"

and, by the way,

"Whatever happened to the Kid who took Alarm Clocks apart to discover how they worked?"

Technology can make it seem unapproachable to understand how things work, when the inside of an alarm clock consists of a microchip epoxied to an LCD display. But It's NOT TRUE! Computers are the BEST Alarm Clocks to take apart!

We want to do something about the decline in the number of kids who actually MAKE things, by helping to develop young peoples inclination to TAKE THINGS APART and understand how they work. We want you to help, and we want to help you with materials you can use in a classroom or workshop.

We have been doing workshops, classes and classroom demonstrations for several years, especially doing 'Computer Demolition' in which we have kids (or older people..) take XT type computers totally apart, learn about the parts and how they connect, rebuild the machines up from an empty case and debug them. We also have been teaching "Bits&Bytes" which is a beginners level look at computers and electronics, using old PC's and PARPORT software that we developed for educational purposes. Many hobbyists have used PARPORT for starting out in Robotics and Computer Interfacing. We have helped many IBM technical people go out into classrooms to do Computer Demolition. We are making some of the materials we have developed available to anyone who is interested.

Oh.. 'WE' are: Terry King and Mary Alice Osborne, AKA "Mountain ClockWorks", who produce Educational Materials and Custom Clock Designs from our log cabin ...In The Woods In Topsham Vermont. Someday we may write a book on these subjects and make some money. Maybe. We would also like to market some kits of parts to make it easy to do hands-on workshops.

What we have available:

- The Computer Demolition Handbook: (Online .PDF , 28 pages and growing)

- PARPORT.ZIP : Easy-to-use Parallel Port interfacing and programming

- Bits&Bytes : Materials to teach / learn about beginning
computers and digital electronics

- AlarmClock2000 : How to reuse parts from old PC's and printers to make
things and learn about electronics.

These materials are in various stages. Computer Demolition is the most complete, with a real how-to booklet. PARPORT (SEEBITS, BITMACH etc.) is very useable freeware, but still needs a good Cookbook! BitsNBytes has some good ideas but needs a lot of added information. AlarmClock2000 is just basic materials, but Mary Alice is working on good drawings of the parts of a 5 1/4" disk drive, and how-to reuse them, and I'm working on the info about reusing old IBM Graphics Printers as winches and cranes. With some encouragement and Winter coming on, we hope to get much more of this finished and out there. Right after we finish getting our firewood in and stacked...

HOW TO GET THIS STUFF (and more information): On the WWW at

http://homepages.together.net/~tking

Here is some more perspective on what these materials are:

COMPUTER DEMOLITION is an activity in which students totally disassemble a working IBM XT type computer down to an empty chassis. We have done this with Kindergardeners and Senior Citizens, but Middle School seems ideal. They learn what the parts do, and how they relate to each other. They then connect the parts together to make an 'absolute minimum' working computer (on the tabletop with no case). After debugging this tabletop machine, they then "build an IBM XT" back in the original case and configuration and get it all working again. All this is usually done in a 80 to 90 minute period. (After the Demolition, some 5th graders have built a perfectly working XT in 9 minutes!). We now have a free online Booklet describing how to do Computer Demolition with kids in your area. We also provide workshops for students, teachers and businesses in the New England area.

PARPORT: Freeware for use of the PC parallel port for input and output.

SEEBITS: DOS Fullscreen Control and Monitoring of Parallel Port Bits
with large 'Bits' that can be seen across a classroom.

SeeBits uses a "Printer Port" (often called a "Parallel Port").
The port is "unscrambled" so that you have one 8-bit output port and
one 8-bit input port using adjacent pins of the printer port.

NAMEBITS and BITMACH: State Machine programming environment that needs
no Compiler to write programs that run from
bits on the Parallel Port. Examples included.

BITS&BYTES:
"How can we learn about those Bits & Bytes we hear computers run on ??"

Bits&Bytes is designed as a hands-on activity for Elementary school and older people in which they explore and learn about "Those Bits that everyone knows are inside computers". Although Bits&Bytes is intended to be a classroom unit that takes place over 8 to 12 sessions, the material has also been used to develop an introductory one session presentation suitable for use in National Engineers Week and other outreach activities. Bits&Bytes asks questions like these:

o What are bits LIKE?
o What do they DO?
o How do bits get IN to the computer, and where do they come OUT?
o How can we get bits to come OUT of the computer where we can see them and play with them?
o How many kinds of bits ARE there?

..and then answers them with demonstrations and hands-on activities.

ALARMCLOCK2000:

"OK, but we want to MAKE Some Stuff!
How can we learn about that, and get some parts ??"

THE IDEA: HUNDREDS OF THOUSANDS OF OLD IBM TYPE PC's and PRINTERS ARE BEING DISCARDED BY BUSINESS & INDUSTRY OVER THE NEXT COUPLE OF YEARS:

o This 'Old Iron' equipment can have great educational value IF information about how to utilize it is made available.

o There is a unique opportunity to allow kids and teachers to take these devices apart and learn about technology.

o Technical Professionals and Professional Educators need to work together to capitalize on this opportunity.

We MAY have some preliminary drawings available hardcopy, which are not yet in the published information, IF you are about to actually start a class. Get in touch.

Comments and suggestions are welcome. E-mail: tking@together.net

Thanks Bud for the nice comments. Perhaps I can answer a few questions
here.
I'm not sure why my call sign was edited out of the manuscript. I don't
know if the editors in place at the time realized what it indicated.
Hopefully it will be in an upcoming or revised edition.

The story behind the number-3 welding cable is a design shortcoming that
is corrected in the updates. The addition of a simple 3-transistor
voltage
regulator makes it much less sensitive to supply regulation. The cables
helped before that fix was in place. They do however, make great supply
cables with very little voltage drop!
I'm just beginning to get my web page set up and hope to have more
information
on it in the future. See the attached text for a few additional
specifications.
73,
Randy L. Henderson, WI5W

I don't have a detailed list of specifications
on the transceiver. This is partly because there are so

many options as to how you could build it. I will try to mention a few here.

receive sensitivity is around -115dBm for minimum detectable signal (by ear).

Blocking dynamic range was over 120 dB.

Third order intercept dynamic range- unknown, I have not performed this measurement. I don't remember having ran into hearing third order products while on the air.

LO phase noise and composite noise is probably as good as or better than most commercial rigs.

When tested on a high quality spectrum analyzers, we could not find the opposite sideband or carrier. The were below the noise floor of the instrument, better than 80dB below the desired sideband with a single tone input.

At that time, it had a FMing problem which invalidated the two-tone transmit test. With that now fixed (and in the updates) I receive reports of excellent audio quality which seems to indicate low amounts of distortion when transmitting.

Transmit power is approximately 50 watts and is continuously adjustable to less than 1 watt.

It has quick TR turn-around times which should be good for digital modes. You can hear signals in between 30-wpm dits.

The SSB filter bandwidth is about 2.7kHz at 6dB down and the narrow CW filter is 600Hz.

Far circuits can supply boards and programmed EPROMS, The web address for FAR Circuits is http://www.cl.ais.net/farcir/

I finally have my web page up. It's http://www.flash.net/~randylh/

3648. Re: Pre-emphasis needed?

Newsgroup: rec.radio.amateur.homebrew

Source record: 77903

If you want the audio not to sound muddy and bassy, YES
you need a pre-emphasis network but NOT like FM Broadcast which
uses a 75us time constant. NBFM uses a different constant.
An easy way to do it is use a .005 in series with a 10k resistor
at the input to an op amp...that will give you the desired effect.

These devices are some beautyfull creations, that protects I/O ports from
being grilled under lightning and such cases. They protects against fast
signals on a communication line (data or handshake line). The center pin

connects to a capasitor and that capasitor is a coil to each outter pin. What precise the numbers stands for is out of my memory, but in this case i would guess on -3dB at 100MHz, max 0A2 and 90V.

>
Thank you for the followup info.

Yes, the long string in the first post inputs 0x820 then it loads R with the 232040 substring specifing the reference frequency thus the VHF step size. Then it inputs 0x7684 and loads it into N with the substring 010040 to set the frequency. N data is equal to (l_freq - 10850) / 5 (l_freq is in kHz, N data is hex). I'm guessing it also pulls band and demodulator lines to the correct state but there is no obvious mention of these. I need to study the sample code closer to ferret this info out.

Please post more stuff like this if you have it. Wonder if anyone has any programming data on the old REVEAL radio or TV cards. I have both but broadcast gets boring...

>Thank you.

How about busting the glass off of a small panel lamp, run just enough juice thru it to get the filament kinda' hot, but not glowing, with a constant current power supply measure the voltage across the lamp, or with a constant voltage supply measure the current thru the filament. The faster the wind the more it cools the filament - the lower its resistance - get it? You could even use two lamps to make up half of a bridge so ambient temperature wouldn't play with you as much (one shielded from the wind of course). No moving parts.

An o-ring as a drive belt is not really a good plan (except in an emergency). I tried this (being self sufficient and having a large assortment of o-rings) on a Sony cassette deck. It worked for a while and then ruined the bearings in the drive motor. I consulted with a good friend who repairs consumer electronics professionally (I do industrial instrumentation). He'd seen this done before. He explained that usually the o-ring will not be the correct diameter. It is generally slightly smaller than the OEM belt. It will drive the capstan, but will also generate excessive lateral friction on the bearing surfaces and wear them out (in short order). You'd be far better off to find the correct replacement part. It will give you the correct belt tension. Try a local TV repair shop. Hope this helps.

Wow, that's a shame. Like you, I packed my gear away in the late 80s, although for different reasons (marriage+kids+school+job=no time). Just recently, when we moved, I thumbed through my old logbooks; comments like "great ragchew," notes about the person's family, interests, etc. abounded. I remembered friends like Ira WA1W (no kidding) and Jim (N1DDU) who were good friends made through ham radio.

In fact, about half of my log entries contain some personal notation about the other ham, indicating that I had acheived some reasonable level of communication with them.

Thankfully, having moved, I threw up a sloper, pulled the gear out of the attic, and am active again on HF.

It is interesting that I so much missed in ham radio what you claim to have never experienced.

Avery

> there be a need for matched pairs of audio preamp tubes?

Low noise audio amplifiers perhaps? Post detector in an SSB rig, or a high
quality
broadcast receiver. I expect they make good IF amplifers as well where the
IF is
low enough to be amplified by them. Low noise IF amplifiers are an essential
part
of a receiver - even a valve one.

Telco surplus.

48 volts is the standard voltage for DC-powered CO (central office) equipment.
A lot of PBXes also use this, and you will frequently see the power supplies
at flea markets near the major manufacturers and service depots for the
biggies -- like Ericssen, Nortel, AT&T, etc.

If you're desperate enough to pay full pop, I can point you to
some industrial suppliers, but you'd do as well to look in the Allied catalog.

3670. CB to 10m CW conversion?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-19 00:00:00 UTC
From: k5dh@rtis.ray.com
Message-ID: <70fq71$lsm@sf18.dseg.ti.com>
Source record: 77912

Has anyone done a 10m CW conversion on a CB radio? I am aware of most of the magazine article conversions, but I was curious if anyone had anything original they'd done themselves.

I've thought about using an older 23 channel crystal-mixed rig as a starting point. I'd replace one of the crystal oscillators with a homebrew VFO and beat that against the other oscillator. Most a-m CBs used a 455 KHz 2nd I-F, so a homebrew BFO would be a cinch to add. It could be made variable to give adjustable BFO pitch. The dual conversion receiver in most CB rigs performs well at 28 MHz. The a-m modulator is easy to defeat, and the last driver and the PA could be keyed.

Also, has anyone done a CW conversion using a SSB CB rig, taking advantage of the product detector and BFO? I was thinking that the a-m receiver could be disabled and the SSB receiver set up to be "on" all the time during rcv, and the a-m transmitter could have the modulator taken out and be keyed. If SSB operation wasn't desired, the transmitter could be re-biased for class C operation and keyed at a low level. Any thoughts?

Of course, with all the bootleg CBers invading the low end of 10m, CW operation may no longer be possible, and this project may be a waste of time! :(

Source record: 77916

This is going to be vague, but someone did describe a CB set conversion to CW in 73. Must have been early eighties. I think he activated the transmitter at a low level during receive to act as a BFO. Then some time later he did a followup article that added a product detector and BFO. One thing I do remember is that he was converting one of the synthesized rigs. I think he must have set up the rit control to be active on both transmit and receive, for tuing between the 10KHz steps.

I don't remember anyone mentioning CW when it comes to SSB CB sets. I've seen conversions of them to 10M, but I don't recall any mention of using them for CW. They would have the advantage of a narrower IF than the AM sets.

It would probably be easier to simply set an SSB set to SSB, and then either use the key to unbalance the balanced modulator. Or perhaps inject a pure audio tone into the audio chain of the transmitter. By keying it, you would in effect be sending a CW signal. One of these paths is probably simpler than figuring out how to wire the receiver to SSB when the transmitter is on AM, and then figure out how to key the AM transmitter.

I have the following that is surplus to my needs.

I am asking $550.00 OBO Not including shipping and crateing.

25 kW MODULOAD ◆
MODELS 8645-115

Power Rating: 25 kW continuous
Frequency Range & VSWR: 1.1 max. 1 kHz to 900 MHz (dc for continuity checks)
Ambient Temperature Range:
Coolant 100% Water, @ <25 kW: +5 deg. C to +30 deg. C.
Coolant 100% Water, @ <20 kW: +5 deg. C to +45 deg/ C.
Coolant 35% Ethylene Glycol, 65% Water, @ <25 kW: -20 deg. C to +25
deg. C.
Coolant 35% Ethylene Glycol, 65% Water, @ <20 kW: -20 deg. C to +35
deg. C.
Connector: 8645: 3-1/8" EIA Flg 8646: 3-1/8" Unfl
Load Coolant: 9 qts. (8.5 liters) 100% water or 65% water/35% industrial
Ethylene Glycol. With forced air cooling.
Operation Position: Horizontal only
Finish: Light Navy gray baked enamel (MIL-E-15090)
Nominal Size: (excluding connectors) 25-15/16"L x 19-5/32"W x 19-9/16"D
(659 mm x 487 mm x 497 mm)
Weight: 155 lbs. (70 kg)
AC Power:
8645-115: 11 amps @ 115V 60Hz

Thanks,

Neil L. Chavigny

The question was 'why matched pairs of AF pre-amp tubes'
why would a one valve receiver need a matched pair ??

Rod,
If you are;
1. determining what your full output power is at a given freq
2. reducing am carrier to 25% of that full power amount
3. while monitoring your alc increase your mic gain until the alc just moves a little bit.
4. monitor your alc during transmission and when you get excited or speak louder cut back the mic gain and vice verse.
You are as clean as your fine product of Japan can be on AM. Usually you can put a good mic on your rig and only the most astute operator will be able to tell your not on a DX-100.
Enjoy,
Art

You could also use a set of ultrasonic transducers and measure the doppler shift to determine the wind speed and direction (you would need at least 2 pairs for this), but I think it will be sensitive to temperature and humidity.

A LLLOOOONNNNGGG time ago in Byte magazine there was an article about how to determine wind speed, direction, air temperature, and humidity using this method. (Sorry, that is all I remember about it.)

Source record: 77849

Somebody just posted a reply to my question, and I somehow erased it...
sorry. If you could repost that, I'd appreciate it.

I know that the filter might not be exactly highly selective, so I am
already anticipating having to cascade a couple (or three) together to
make it work. But, it doesn't have to be a kickin' radio--just one that
works good enough to get the grade.

One of the specs in our prodject, in order to get a higher grade, was to
add on SSB capabilities. And, it would be nice to at least hear what
else is going on in the band, not just CW. That is why I am trying to
get the radio set up to "hear" the voice already, and be that much
closer to being ready for the SSB mod.

You were right, in that I had the equation wrong; it ought to be:
(freq desired) - (455kHz + 2kHz)
in order to use the stopband to attenuate the signal.

3687. Help, designing RF remote flash trigger

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-20 00:00:00 UTC
From: Rob <yd3ebm@rocketmail.com>
Message-ID: <362C7798.5FD7CBFD@rocketmail.com>
Source record: 77850

Hi,

I want to build a simple RF remote photo flash slave unit. I think that it will require < 1ms delay (my camera can sync upto 1/500), low sensitivity to RF noise (e.g. from local tx) and reliable. In my mind, I'm thinking about building a pulsed VHF RF tx (pulse duration ~1-2 us, triggered from the camera's PC socket/hot-shoe) and a simple rx with front-end LC BPF, RF pre-amp, a high speed rectifier and a Schmidt trigger. Does this idea make any sense? Any suggestions are welcome.

thanks
Rob

Avery OM,

I could not agree more. Every day, twice a day, I am on the air for 30-45 minutes, morning and evening, on my way to/from work. 40M CW mostly. Almost every day I have a great QSO with someone, and we cover all kinds of ground from family, QTH's, antennas, rigs, weather, bio's, you name it.
This morning on 40CW I got a call from an old friend from 18 years back. We both flew the same kind of airplane (Mooney M18 Mite) years ago, so we had a lot to talk about. Just one example.
There are LOTS of FB ops out there, at least on CW. I can't provide any info re: phone, since I am not a phone man.

73 and Enjoy,
Don, W6JL

>of these in a full wave configuration?

Yes, but it missed the point about removing the magnetic shunts. That
circuit needs two identical transformers, and you still need to find
some way of lifting the inner end of the secondary to allow metering in
the HV-minus rail.

Cascading the filters won't change the selectivity. It will improve the shape factor though. If you can scrounge up a CB set, I assume the 455KHz filters in those are at least somewhat narrower than in an AM broadcast receiver. A 455KHz IF transformer would probably have narrower selectivity, but it will have a lousy shape factor. Cascading a number of 455KHz IF transformers might be a better choice than a ceramic filter in cases where you need a narrower filter but can't get them because of cost or availability. The If transformer provides the selectivity, and the cascading improves the shape factor.

A simple crystal filter might give better results. If you go with a frequency commonly available, such as even a color subcarrier crystal from a tv set, it will have the advantage of better image rejection. The simplest filter would be the classic circuit with a single crystal and a phasing capacitor. Or a ladder filter might give you better control over bandwidth.

Ok, you're right; cascading them won't get too much more selectivity; it
will just help the skirt--which was what I was worried about more of. I
bought a 4kHz wide filter, and planned on LPF'ing the signal after the
final mixer. Right now, I want to characterize the filter I have and
see if I need to step up to a better filter, or if I can get away with
what I have.

The ARRL antenna book has complete plans for the 1296 Mhz antenna including the feed method and a lot of other neat tips. I tried one of these on 2M using the formula I had for a VHF quad and it worked pretty good. Personally though I prefer yagi's and Quagi's on VHF and above. They seem to have a bit more gain than the quad on long boom antennas. I yet to venture into 1296 land. Don't know how they will do up there.

: Hamm4fun (hamm4fun@aol.com) wrote:
: The circuit I saw of thisa used an"L" network with a series inductor on the
: input. This would indicate that the input impedance was less than 50 ohms for
: 2 tubes in paralell. I too was thinking about trying this circuit but one of
: the things that tume off to it was its low gain (6db) in GG. Bill Orr had a
: discription of this amp in one of his older books. I found a copy of it at a
: college library but could not check it out.

The drive impedance would be configured by the type of circuit and it's
operation. If your running Grid Driven, the impedance is going to be very
high.
When you drive the cathode the impedance is much lower.

Most of the handbooks from the 70's through the 80's have designs of both
types.

You end up building one or the other by how much exciter drive you have
avail. The grid driven operation is most often the high gain type.

John,
If your talking about the round two, three and four pin winchester connectors, I buy currently from Newark. If you email me direct at the address below my name I'll give you more information if I can.

Well Michael,
You don't say what frequency range your amp is going to be used at/for? It would also help to know a little more about what type of circuit it is, ie tubes and config. That would tell us the typical HV rating you might need.
cheers

Dean,
a good idea....and you have the points on how to convert to 10M CW
right on......I say go for it....you shouldnt need any help..
as to a SSB rig for CW operation, no problem.....feed a CLEAN 1kHz
sine wave into the mic input with the mic disabled....this will
create a carrier 1 kHz off the rcvr.....what more could you ask for?

Jeffrey,

Are you a moderator of the Rec.Radio.xxx NGs?? I saw nothing
in the below to tell me that.....if not, what authority do you
have in any of the groups??? Are you a user who has made up the
FAQ below? or are you a moderator with control over the charter?
Your posting about rec.radio.amateur.equipment NOT being for
posting for sale msgs leaves me somewhat baffled....and again
I ask...by what authority do you make such a statement?

Please provide a copy of the CHARTER of the NG to back up your claims.
Your own words are not law unless there is evidence to back it up

Hello All,

I'm restoring an older piece of equipment for which I need couple seven segment single digit led modules. The original module is a Stanley S-250A. It appears to be a pretty standard unit with an unusual pin out. I could rewire for a commonly available unit but prefer to find an original if possible. Anybody out there got one in their junkbox your willing to part with? Appreciate any help.

Thanks .. Larry

As long as you have to apply sreen voltage and control grid bias, why not consider the following "passive grid" approach?

If you have 100 watts of drive available, just hang a 50 ohm non-inductive resistor to ground from the input connector. You will develop the correct voltage to drive the grids of the 4CX250Bs and you can just couple it through a .01 mf transmitting mica capacitor. Isolate the grids from the bias supply bus with an RF choke, and you are all set without the need to tune or bandswitch the input circuit.

With the input impedance so low, stability is inherently good. You can use a Heathkit or Dentron "Cantenna" resistor under chassis in the air stream, so cooling is adequate, too.

> --
I was making an assumption, that now appears wrong. I was figuring that
you'd taken the ceramic filter out of an AM radio, and simply hoped that
it would be 4KHz or so wide. I think in AM radios they tend to be wider.
But since you bought it, I guess you have the specs, so my assumption is
wrong. I'm sure the filter will be narrow enough for your purposes. It
may not be easy to tune in one CW signal, but there were plenty of
receivers in the old days that people used that did have that sort of
bandwidth. Especially if this is more a demonstration unit. If you can
easily get some more of the filters, it probably would be interesting to
try cascading some. I've been curious about trying that myself. In the
long run, if you find you like the rest of the unit, you could probably
wait until you can scrounge up a better filter somewhere.

Yes. The AL value is proportional to the cross-sectional area of the core. Stacking two of the same cores doubles the cross-sectional area, so the the AL doubles.

Conversation is what you make it. If you didn't like the topic, you can change it can't you? People talk about radio's because thats usually the first thing that comes up. I've never had any trouble changing the subject. The part about talking to foreigners I don't understand. I don't talk to them any different than I do stateside. I've never viewed dx stations as cb'ers or children. Just another station as far as I'm concerned. I've spent hours ragchewing with dx. Ever try 160 m? Plenty of interesting conversation on that band. If you hear hams using banal conversation , maybe you should jump in and debanalise it. MK

Sounds interesting.
Does anyone know if the Co making these has a web site ?
Also what is the upper frequency limit of the spectrum analyser ??

I got a pair of these Y-867 tubes, made by Eimac, and
I think they are 4CX250B like tubes, at least they look
like it, but I'm not sure about filament voltage, etc.
Any ideas?

The circuit I saw of thisa used an"L" network with a series inductor on the input. This would indicate that the input impedance was less than 50 ohms for 2 tubes in paralell. I too was thinking about trying this circuit but one of the things that tume off to it was its low gain (6db) in GG. Bill Orr had a discription of this amp in one of his older books. I found a copy of it at a college library but could not check it out.

If you're looking into this, I suggest you get the august and september
issues of QST magazine;
there is a spectrum analyzer project published there which is superior to
the designs based on CATV tuners.

The CATV tuner based designs reportedly suffer lots of spurious response
problems, and generally aren't useful for any sort of accurate
measurements. (Although I've not built or tested one.)

The QST SA design is by Wes Hayward W7ZOI and Terry White K7TAU, and it
uses minicircuits vco, monolythic amps and diode ring mixers. In case it's
not obvious, I'm in the middle of building this project. :-)

The range of the W7ZOI/K7TAU design isn't as wide as the outrageous
coverage you get with a CATV tuner, but it is free of spurious responses
and can be improved upon more easily than the tuner designs.

Here are a couple of URLS:

http://www.bright.net/~kanga/kanga/sabdinfo.htm (circuit boards
and parts kit)

and

http://www.teleport.com/~w7zoi/SA.html (authors notes
and errata, etc.)

3721. 80m Transciever

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-20 00:00:00 UTC
From: Shawn Upton <supton@eece.maine.edu>
Message-ID: <362CB263.167E@eece.maine.edu>
Source record: 77942

I've got a question: For my senior design prodject here at school, I am (attempting) to build an 80m CW transciever. Nothing too fancy; just a superhet, using some shortcuts that might make for a not-too-sensitive radio, but would fulfill it's desired purpose--to allow me to graduate!

The design will be using several high-speed op-amps, and a AM bc band-type filter (455kHz, 4kHz 6dB bandwidth) for much of the innards. But, I'm getting away from my question--on 80m, the standard is to use lower sideband, right? So, what do I do if I want to recieve lower sideband on this radio also? I am thinking of using the VFO to tune to (desired freq) - (455kHz - 2kHz), so as to set the desired tuned frequency to the edge of passband (falling side) of the IF filter. Is this going to work? I recall talking to a friend who told me something that I can't recall correctly but made me think that this idea might not work.

For lower sideband you want to tune the VFO to (desired freq)
+(455kHz + 2KHz). For lower sideband the VFO has to be above the
signal frequency.

Actually for CW, you don't have 'upper sideband' or 'lower sideband'
anyway, so it doesn't matter. You might want to try changing the '2KHz'
part to '800 hz'. It will make it easier to copy the cw. You should
expect not very good selectivity using BCB filters.

By the way, the use of lower sideband on 80 (and also 40 and 160) is an
anachronism. In order to simplify things in the early side band rigs
they used a 9 MHz IF with a 5 MHz VFO. This permitted the use of lower
sideband on 75 M (9-5 = 4 MHz) and upper sideband on 20 M (9+5 = 14 MHz).
Only one single-range VFO was needed, and the only band switching was in
the antenna side of the RF stage. If you _really_ wanted to skimp you
could design a tuned circuit that covered both bands at opposite ends of
a single variable capacitor (but that opens up the possibility of

spurious signals on the unwanted band).

I have legally monitored cellular transmissions in the USA with legal
monitoring equipment.

Of course, I was working for Airtouch at the time.

There _is_ a legitimate use for such things, but not on this usenet.

3729. FS: 1 Linear Amplifiers

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-21 00:00:00 UTC
From: Marv_E_Ads@Juno.com
Message-ID: <70ls3q$983$1@nnrp1.dejanews.com>
Source record: 77802

Hi, A friend of mine recently became a silent key and in his estate are one and a half amplifiers that may be of some interest to someone on this group.

********** The Linear
****

There is a large linear that was under construction. It.is just sort of started. Socket mounted, air system complete, nothing much wired.

The valuable parts are: A 4CX5000A (the best of 4 which he owned at one point) A 4CX10000D (which looks well used) An Eimac SK-300 socket, fairly good used condition (only a couple of the contact fingers are broken), SK-306 & SK-1306 chimneys (one for each tube) A Johnson 200-205 ribbon coil -- 15 uh looks fairly new There are two new Groth turn count dials on the front panel but, the knobs for these dials which I think I saw laying around a couple months ago, are no longer in sight and may or may not turn up.

There is an assortment of transformers mounted in the bottom of the cabinet:

A new looking filament transformer marked 7.5 V 100 Amps.
A older 8" or so cube with some diode strings on top that I suspect are for the screen. There is also a string of six 200V 50W zeners with heatsinks mounted to the side of the cabinet, obviously for the screen.
A choke for the screen supply.
And two or three more small transformers that may be for control or grid bias.

The air system has a plexiglass plenum and an apparently new dual squirrel cage fan. The fan is just hooked up with test leads.... There is a commercial manometer with its tube attached to the plenum but the manometer itself is not mounted to anything.

The cabinet is a gray 24" panel size rack type. There is a panel for the front of the amp and a latch released door for the back. There are no panels in the front below the shelf where the tube socket is mounted.. The cabinet is 44"H x 27"W x 24"D overall. It has a few scratches and blemishes as it has been rolling (on casters) around in the garage for years. It probably weighs about 150 lbs. with the above described parts.

There is no part of a plate supply evident...

********** The operating Linear **********

Dick, the silent key, acquired a commercial (AM?) transmitter a long time ago and built and rebuilt his own "daily use" amplifier in this case. It is

currently configured with a pair of 450TL's (plus at least 6 spares), in grounded grid. He used to drive it with a Heathkit SB-220 & I believe it runs about 4 KW SSB. He ran this thing for YEARS! so at least it is reliable. :-)

The nicest part is that it has:

Good coils switched by a very nice homebrew bandswitch.
Vacuum variables (300pf@10KV? and 1000pf@3KV? -- I am unsure of the voltage ratings, they may be higher),
Real input tuning
and
a (original, I presume) commercial meter bridge with 7 meters across the top.

The Power Suppy components.

A 240 volt variac (1 foot in diameter) rated perhaps 50? amps

The transformer is some kind of fairly modern (mid '70's vintage?) monster. Rumor has it that it was originally made for a shaker table amplifier. The U-I laminations (which are most of the thing) on the plate transformer measure overall 18 x 11 x 6. I would estimate that it weighs at least 300 pounds. It is likely at least 10KW CCS rated. It is open frame with some eyes at the corners for the crane to hook up to... :-)

The diode bridge is comprised of a zillion low voltage diodes in a fairly cute plexiglass housing.

There is an 8H, 1A choke made by Collins

a whole bunch of 1uf 5KV caps (12?) wired in parallel plus six 54 uf, 2500V continuous DC rated (they are actually laser caps) wired in series parallel (36 uf / 7.5 KV effective). Note: One modern capacitor would be physically smaller than one of the laser caps and be rated higher than all these put together!

There are some odds & ends like a giant power contactor, main circuit breaker, a 7 meter bridge assembly, and of course the rest of the stuff to make the 450TL's go.

The bad part is that the cabinet is navy gray, about 7' hi, about 3' wide, and 2&#65533;' deep and the whole thing likely weighs 700lbs....

****

I would like to sell both of these units together for $1500. The variac, power transformer, vacuum variables and some of the other components from the 450TL piece would go along way toward completing the other amp. You could just toss the big cabinet on the way out of town... but, please don't let the widow who helped repaint the thing 30 years ago see you do it!

I am afraid that this stuff does not easily lend itself to shipping which would certainly have to be by truck freight. A lot of the parts would have

to be removed and packed separately. The big transformer for instance is not bolted down and would have to be palletized. If you are far away, perhaps you have some friends in Los Angeles you could impose upon. :-)

Thanks for reading all of this & have a nice day!

73,
Marv WC6W 310 649 3111 (Reasonable hours Pacific Time please)

Are You shure, that this works with the 4CX250? I know this works for newer tubes like the 4CX400, but AFAIK due to the internal structure of the 4CX250 passive grid excitation is not suitable with this tube (to be frank, I have not seen a 4CX250 design yet with passive grid input, they all use tuned input circuitry).
BTW, these tubes don't seem to be suitable for grounded grid operation. If You prefer a grounded grid design, use a triode instead.

Dear Leland and Group:

Eimac has a web site at www.eimac.com. It appears that their distributer
is Richardson Electronics.
There is an 800 number to call for more info. They can probably help you.

Best regards,
Ben Hawkins

Dear Allan and Group:

I have built and still use a similarly designed unit from A&A Engineering. It, too, is based on the swept CATV tuner. It works, but it has its limitations. Spurious responses are a problem, but since I work only CW, I am able to ignore them for the most part. I built the kit about six or seven years ago, and enjoyed the new experience of being able to see the spectrum in real time. It is very interesting to see what the TV and FM signals look like in frequency domain.

Now, I probably would not spend the time and expense to put one together, considering the very reasonable price of an older HP or Tek analyzer. The prices for these excellent older units is still dropping. Unless you really like to build test equipment, you might be better served by giving in to economic reality and buying a name brand, first quality machine to use in building something else.

Good luck with your projects!

Best regards to all,
Ben Hawkins

Geert, transmitting without a license is illegal in the Netherlands. However, if you are inclined to build a transmitter then it is probably best if you learn some of the basics first, for example by reading RSGB Handbook or ARRL Handbook. Doing so will also enable you to ensure that you are transmitting on the frequency that you intend to and that you cause a minimal disruption to the services authorised to use that (and other) parts of the radio spectrum. The above books will contain the necessary information to make almost any kind of transmitter.
I believe that the books can be ordered from VERON, a dutch amateur radio society. Have a look at:
http://www.veron.nl/hobby/nl/
and consider amateur radio, which will legally allow you build and operate your own transmitter (subject to licensing conditions).

Groetjes,
Laurens de Bruijn M1CCO

No, it doesn't make sense. A 1 us pulse will have a bandwidth in excess
of 10 MHz. That puts your signal outside the amateur band, not to mention
that using pulse modulation is illegal on VHF anyway. The receiver *will*
false on nearly any bit of noise or RFI in the area too since it will also
need a wide bandwidth to recover the pulse. The latter is the practical
reason you don't want to do this.

(Note, you could use a powerful pulse, and a very deaf receiver. That
would work without too much falsing most places, but it would be very
anti-social.)

You need a coded narrow bandwidth signal to be legal and avoid
false triggering. That can be a digital code, as in digital coded squelch
systems, or it can be a tone combination as in DTMF signaling. There
are single chip DTMF encoders and decoders available, and most any
FM voice grade radio will pass the tones, so this is the simplest
course.

One drawback to DTMF signaling is that you need a tone of about
30 ms duration for reliable signaling. That limits you to a shutter
speed of 1/30th second or slower if you trigger from the hot shoe.

Use of a digital code will allow a precise synchronization because
it will trigger precisely when the last element of the code is decoded.
That will be a fixed duration after code transmission starts. But the
duration of a coded transmission may need to be longer than 30 ms for
reliable anti-falsing, so the delay poses a problem with higher shutter
speeds too when triggered from the hot shoe.

The solution to that is to not trigger from the hot shoe. You want
to start the trigger transmisson to the strobe and then trigger the
shutter after a precise delay. So your box needs to have a fire button,
a transmitter to send the coded signal to the strobe, and a remote
shutter release to the camera fed through a delay equal to the
strobe decoding delay.

Digital code generation and timing delay for shutter triggering
can be handled by a PIC. Another PIC on the receiver end can
decode the signal and fire the strobe. Ordinary FSK Tx and Rx
form the link. The Tx trigger can even be remote from the camera
if desired by adding another receiver/decoder for shutter release.

This system will be essentially 100% immune to falsing, and
can synchronize at any shutter speed. It can also be used over
significant distances if remote operation is desired, such as
for security use or nature photography.

>that I can't recall correctly but made me think that this idea might not
>work.

To select which sideband you get, your *product detector
oscillator* (BFO) will have to be offset to one side or the other
of the signal. For lower sideband, it has to be above the signal,
and for upper sideband it has to be below the signal. In either
case, it has to fall *where the suppressed carrier would be* if
it were being transmitted. A drawing may help;

-----LLLLLLLL--X--UUUUUU-----

The L's are the lower sideband, the U's are the (suppressed) upper
sideband, and the X is where the product detector BFO goes. Since
the BCB filter is so wide, and the shape factor likely poor, it doesn't
much matter where you locate it with respect to the signal. But to use
it the best you can, locate the BFO carrier near the upper edge of the
filter passband so that signals above your desired signal are attenuated.

This is a totally separate issue from where the VFO will be.
It can be 455 kHz above or below the signal frequency. Your
choice. If the VFO is below the signal frequency by 455 kHz,
then the signal will appear "right side up" in the IF. If the VFO
is above the signal frequency, the signal will appear "upside
down" in the IF.

With a high side VFO, tuning will be backwards across the band,
and the sense of the sidebands will be reversed. So you'd want to
place the BFO carrier at the lower edge of the filter to receive lower
sideband. In other words, you'd set up the IF as if it were receiving
upper sideband because the IF signal will be mirror imaged from

the signal on the band when the VFO frequency is higher than the signal frequency.

This may make more sense to you if we run some numbers. Assume we have a LSB signal with a suppressed carrier frequency of 3.900 MHz. It is modulated with a 100 Hz tone, a 1000 Hz tone, and a 2000 Hz tone. These tones will appear on frequencies of 3.8999 MHz, 3.8990 MHz, and 3.8980 MHz respectively.

Now if the VFO frequency is 3.445 MHz, the difference frequencies will be 454.9 kHz, 454.0 kHz, and 453.0 kHz respectively. But if we use a high side VFO tuned to 4.355 MHz, then the tones will appear at 455.1 kHz, 456 kHz, and 457 kHz respectively. The order of the tones *will have reversed*, so LSB will look like USB in the IF.

Note that in all cases, however, the BFO has to be at precisely 455 kHz to correctly demodulate the tones in the examples above. Of course, if you offset the BFO to one edge or the other of the filter, then your tuning is offset by an equal amount as to where the VFO will be when the signal is properly tuned. That's a simple dial calibration issue, however, and you needn't be concerned about that.

I have built several this way, "passive grid" is a new term for me, I think I had always refered to it as "swamped grid". Some with a 50 ohm resistor, others with 100 ohm connected to the exciter through 1/4 wl of 75 0hm cable and most recently 200 and 800 ohm ones using broad band UNUN's. So far I have used this method to drive paired and tripled 6146's 4CX250's/ 300's and a 4CX1000. For the most part these are piece-of-cake amps to build. The only problem is overdrivng them, the grids can't take much and you can blow some expensive tubes in a hurry.

BTW: I found a note I ad written down that says input impedance for a 4CX250 GG is 100 ohms. This was associated with a drawing with the grid connected to the cathode and the screen grounded.

No. The only difference between low side and high side VFO injection
is that high side will mirror image the sidebands in the IF. In other words,
upper becomes lower and lower becomes upper. (Well, the VFO tunes
backwards with high side injection too, and that can be a nuisance.)

What determines which sideband you receive is where you place the
product detector BFO with respect to the signal in the IF. It must
be above the signal for LSB reception, and below the signal for USB
reception. In other words, it has to be where the suppressed carrier
of the signal would be if the carrier weren't suppressed.

The only problem with using a 50 ohm swamping resistor with these
tubes is *too much drive*. They have a lot of gain in tetrode configuration,
and don't need much grid drive. So what you really want is a passive
attenuator if you're going to use a 100 watt exciter.

>the 4CX250 passive grid excitation is not suitable with this tube (to be
>frank, I have not seen a 4CX250 design yet with passive grid input, they
>all use tuned input circuitry).

There have been many passive grid HF amps built in the UK with a pair of 4CX250s - the internal structure doesn't know or care whether the grid circuit is tuned or not.

>BTW, these tubes don't seem to be suitable for grounded grid operation.

It depends what you mean by "grounded grid". Cathode drive for 4CX250s is quite possible, if both grids are at *RF* ground but still have the correct DC screen voltage and control grid bias.

But the modern metal-ceramic tubes are NOT suitable for operation with both grids connected directly to chassis. It produces very high control-grid dissipation and rapidly destroys the tube.

>If You prefer a grounded grid design, use a triode instead.

It's more often a case of "I have a tetrode, so how can I use it?"
With UHF tetrodes, cathode drive with RF-grounded grids is usually the preferred mode, because input coupling is much easier than in grid-driven amplifiers and stability is also improved.

Why not just use light to remotely trigger the flash like most
photographers do?

A $15 laser diode pointer can be triggered by the camera and aimed
at the standard optical trigger module that plugs in the front of
flash units. You would have to aim the laser, and you probably would
want to put a collimating tube over the trigger module, or maybe
a filter. Since you are using a camera, you should have line of
sight to your target anyway, and you should easily get several
hundred feet of triggering range.

After doing a web search on "YIG near filter" I see you are right.
Newer filters do go down to 500 MHz. I asked for
a price quote, but so far haven't received any reply.

: Unfortunately not Roy, but it will improve the power handling
: capability.

Um, Dave?? Unfortunately not what?? {Triage time, Roy...}

3 random T80-2 powdered iron cores. (Note: these are NOT
ferrite, Noname.) Wound 25 turns #26AWG magnet wire around one,
and another 25 turns, wire from same spool, around a stack of
the other two. Measured inductance and Q at 100kHz on an
HP4274A LCR meter.

#cores L, uH Q
1 3.848 23.8
2 7.285 31.0

The value for two cores is slightly less than double that for one
core. A better experiment would have been to wind two cores
separately, then wind them stacked, but 50 turns was my limit
this evening. In any event, it's probably within core Al tolerance
of double.

Ok, I missed that point. I read about the problems with tetrodes in GG
somewhere (really don't know anymore where), but I did not think about
the fact, that this is only a *DC* problem. The screen grid is also at
RF ground in a grid driven amplifier.
Seems I still have to learn a lot about tubes...

3764. DIPOLE1.exe

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-22 00:00:00 UTC
From: Reg Edwards <G4fgq.Regp@btinternet.com>
Message-ID: <01bdfde5$13363660$LocalHost@default>
Source record: 77808

Brand new program DIPOLE1.exe is now available by downloading from my website. Only a few seconds to download. Not zipped-up. Can be run immediately.

Basically this program is a more accurately modelled version of Doublet.exe (no longer available). It analyses performance of an HF dipole, centre-fed via any balanced-twin feeder, at a specified height above a lossy ground. Skin effect, proximity effect and ground losses are taken into account. Antenna end-effect and the effects of antenna loading due to mutual impedance with the soil at low antenna heights (a reduction in resonant frequencies) are included in the analysis. Principal assumption - your back garden is similar to mine - the weeds do very well even in dry weather!

The program computes dipole input impedance, uses this to terminate the feedline, computes feedline input impedance, and then computes what you are all waiting for - VSWR with respect to the long-suffering 50-ohm transmitter. Percentage power lost in the feedline and in the antenna+ground system, all comes out in the wash.

After erecting the antenna plus feedline, the program contains facilities to sweep manually over the frequency range and search for resonant frequencies of the feedline+antenna combination. Resonant frequencies occur when the feedline input reactance changes sign from +ve to -ve and vice-versa. Resonant frequencies are not harmonically related. What you hope for is that resonant input impedance remains close to 50 ohms resistive when changing from band to band.. But it seldom is !

And now here's the really good news (anyway I hope you like it) :- The program enables the user to vary feedline length in small increments at a very fast rate, ie, to search for resonance when transmit frequency is maintained constant. Such resonant points correspond to minimum SWR with respect to the 50-ohms which the transmitter is hoping for.

Switch from one band to another and you have a set of performance figures which the program assists you to R(ecord).

If you now change the feedline impedance Zo, can a better set of figures be obtained ? The program provides the tools.

Let me know if you meet any snags.

AL is L/N^2 where L is the inductance and N the number of turns. L is proportional to the magnetic cross-sectional area, which for practical purposes is the cross-sectional area of the core or cores upon which the winding is wound. This can be confirmed by checking any reference on the subject.

Why do you say that AL is not doubled when two cores are stacked? Do you disagree that AL is L/N^2, that L is proportional to the cross-sectional area, or that stacking cores doubles the area? If you've done any measurements which show that AL isn't doubled by stacking two identical cores or can provide any references or measurements which show any of the statements I've made aren't true, I'd be very interested.

E.F. Johnson 229-0203-001 roller inductor mounted in a long solid aluminum box, geared to an electric screwdriver for a remote tuning application (there is a short test wire to another much smaller aluminum box with the control switches). It was tested a couple of years ago and then set aside, it has not been outdoors, so it is nice and clean and the roller looks like new. I have the original E.F. Johnson box and specification sheet (Which rates it as 1.5-30mc, 28uh, 7 5/32x2 1/2x2 31/32", #12 wire). Asking $70. shipped conus for the whole assembly. (I sold my other one for $55., w/out any of these other parts.) 73, DavidC AA1FA aa1fa@qsl.net 603-894-1174

I have the following for sale, prices do not include shipping:

Homebrew RF-Deck uses pair 4-125's, about 500W out needs HV supply:
$150.00
(The parts in this thing alone are worth $150.00)

Unbuilt Heathkit 5-Position Rotary Coax-Switch $50.00

Heathkit DX-60B w/matching HG-10 VFO: $120.00

Heathkit AM-2 Swr Meter: $10.00

Pair Collis Motorized Roller Inductors $75.00 for both!

Two HTX-202 HT's, these are in good to excellent condition, each with
external hand mic/spkr and 1800mah battery. $95.00 Each or $175.00 for
the pair.

Kenwood TS-930SAT w/250hz CW filter, auto tuner, etc... exec condition:
$850.00

Linear Amp Parts (sold as set, will not split): Pair of 4CX1500B medical
pulls, w/1-Socket/Chimney,
Peter W. Dahl Plate transformer a 115/230 VAC primary and a 1250 VAC @
1.5A CCS secondary
8-1500mfd @ 450V Computer Grade caps, pair of 5KV block diodes,
pair of ducted blower fans (pulls from military equipment) all for $400.

AMD K6-233Mhz Computer with 32MB Ram 6.5G Hard Drive, FDD, 32X CDRom,
1M PCI SVGA Video, KB, Mouse, Acer FX-3d Sound Card, 20W Speakers.
Full Tower Case. $400.00

If interested send e-mail direct.

Well I have, they are all right, rather limited as they are.
There was a great mod for their control system that ammounts to a vast
improvement. IMO in some 96 QST issues. They can be tricky to build.
I had little trouble besides a minor burns, but watch the parts list
clsoely. Both myself and the other I have know have had a part
missing when we inventoried them, and One holder of a Genral class has
had no end of trouble assembling the 6m version. I assembeld a pair
of the 220, with only the problem that each was mising a part, not the
same one so I could finish one while waiting for the Ramsey to ship
the missing ones.

is an ITT f-6366 tube good for an hf amp?

itt now triton says it's good to 30mHz another source says up to 50mHz.
120watt drive with 3kwatt output.

just wondering if anyone has used one or wants one.
maybe an approx. value etc.

thanks

Message-ID: <362F17B1.60A8@nidlink.com>
Source record: 77826

What a great idea. I'll have to try that one. I've always put an 1N34 beside the Galena, connected one end to the crystal and the other to a brass screw head, and used the cat whisker as an SPDT to select one or the other.

The old timers might be right, though; it is easy to build a crystal set that *works*, but very tough to build one that *works really well*. The antenna, coils, condensers, phones and detector and even the geographical location of the set all have to be balanced to one another for maximum efficiency. It's sort of like chess, easy to learn but can take a lifetime to master...

As far as oat box coil forms, check out mailing tubes. These are pretty easy to find at the storefronts that will mail things out for you, and relatively cheap. Remember that for maximum Q you need a different size form for each wire size and total capacity of the antenna/set combination.

Hey, does anyone know of a list or newsgroup devoted to Xtal sets exclusively?

3783. Antenna Capacitance

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-22 00:00:00 UTC
From: John & Amy Hern <hern@nidlink.com>
Message-ID: <362F1D38.4A6E@nidlink.com>
Source record: 77827

Any good ideas how to determine antenna capacitance?

In trying to build a better Xtal radio, I'm trying to find the capacitance of my antenna. I have a rough chart, but would like to get better than an approximation. Tried hooking my LCR meter accross the antenna and ground, but didn't get any sort of repeatable reading.

The antenna in question is an inverted "L" of 12ga stranded, insulated THHN wire, about 125 feet long, about 50 feet high, passing over irregular terrain and some buildings. Lead in is perhaps another 60 feet from the antenna insulator to the set.

Thanks for the assistance.

I have and article from 73 magazine where they tied the control grid
to the cathode and grounded the screen . they drove the cathode
+control grid with a tuned circuit. I don't remember if they had bias
but the hit the 4CX250 with 2000 volts on the plate .. If you want I

can Email you the diagram...I also have a passive grid linear design
with the same tube , happy to share the articles

3794. TV-7 tested TUBES F.S.**CHEAP**

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-23 00:00:00 UTC
From: tubecntral@aol.com
Message-ID: <19981022225823.14618.00004491@ng121.aol.com>
Source record: 77830

Hello, I have the following tubes available for immediate sale,or
possible trade for other tubes. ALL the tubes listed here are
totally inspected and tested good, WELL ABOVE MINIMUM on one of my Hickok
TV-7 D/U tube testers, all very accurate mutual conductance units. All
are cleaned, and where possible, reboxed with a label on top. If I don't
have a particular size box, tubes will be safely wrapped. I try to
provide the best packed shipments as possible. All are guaranteed to be
as described apon arrival, or you may return for refund,
less shipping costs. Due to the extreme low prices offered here for these,
a mere 5.00 minimum order is required, plus only 3.00 shipping and
handling for shipments in continental USA,(no matter what size order)
others by rate..Sorry, no picking brands or construction
at these prices,(one dollar extra per tube for special requests) but
these are all top brands, like RCA, G.E., Hytron, Westinghouse,
Tung-sol, Sylvania, KEN-RAD, National Union, and others. The quantities
vary for these, but they run 5 to 1000 pcs. each. These are just examples,
I have LOADS of other types at a similar savings, but may be a bit more
if I have to go digging for it. So, if you don't see what you need here,
just inquire, as I probably have it. Respond for further info.
Great chance get a good spare set cheap..
Thanks, read on....

3795. Help: Lunar Electronics PAG220 LNA

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-23 00:00:00 UTC
From: wb4lnm@aol.com
Message-ID: <19981022232752.14848.00004494@ng115.aol.com>
Source record: 77831

I've been asked to repair a Lunar Electronics model PAG220 low noise amplifier by my club.

It appears that (in repeater operation) it has taken a lightning hit, and that destroyed what appears to be an RF choke (could have also been a resistor, perhaps) from the input BNC connector center connector to ground. Perhaps this was used as a "static drain" in the design.

In any case, the component that was from the input directly to ground was fried, although the active device still looks OK.

If anyone has one of these, or the schematic for same, I'd appreciate knowing what the original shunt part was and its value. We have no record of the unit otherwise. Please respond here, or directly to: WB4LNM @ AOL.COM

Thanks and 73

John...

1. E.F. Johnson 229-0203-001 roller inductor mounted in a long solid aluminum box, geared to an electric screwdriver for a remote tuning application (there is a short test wire to another much smaller aluminum box with the control switches). It was tested a couple of years ago and then set aside, it has not been outdoors, so it is nice and clean and the roller looks like new. I have the original E.F. Johnson box and specification sheet (Which rates it as 1.5-30mc, 28uh, 7 5/32x2 1/2x2 31/32", #12 wire).
Asking $75. shipped.

2. Huge 208uh roller inductor 11" long, 4 1/2" x 4 1/2" wide (good for remote tuned vertical, has hairline crack in glass rod tube the tap slides along, doesn't seem to affect anything)
Asking $35. shipped.

3. KenPro KR400 and KR500 rotors (very similar to Yaesu rotors of similar numbers, vertical and horizontal, complete but need work), KR500 Control box, Yaesu G-400RC control box for the KR400 (control box needs a new switch) w/manuals. Asking $125. shipped as is.

4. Mosley TA-33 Tri-bander 10-15-20m. Asking $125. picked up in So. NH

5. KLM KT34XA w/the 3" heavy duty 32 foot boom and new element caps. Trade for a pair of long boom 4 element 20m mono-banders, or $450. picked up in So. NH. (May consider both the KLM and TA-33 towards a pair of the right 20m monobanders)

3799. COR make 440 AMP unstable?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-23 00:00:00 UTC
From: af389@lafn.ORG
Message-ID: <36308AE5.99E4231B@lafn.org>
Source record: 77835

Hi,

I am working on a Swap Meet Special
Outboard Class C 440mhz RF AMP with bypass COR circuit,
(carrier operated relay). 1 watt input for 25watt output.

When AMP is operated without COR, driven directly from HT,
AMP is stable and has clean 444 mhz and 888mhz output
on Spectrum Analyser (SA).

When I add the bypass COR circuit that came with the AMP,
the AMP becomes unstable, and causes MANY BLIPS
on SA. Tuning is very erratic, power jumps up and down with
small changes in trimmer settings.

This appears to be problem with the COR circuit
board and it's 4 coax cables. Or, is it more sutble than that?

Can the COR be repaired, redesigned,
or replaced with good commercial unit?

Can I use another method to BYPASS AMP during receive that
does not make AMP unstable? Quarterwave coax and diodes?

I am looking for suggestions how to use this 25 watts RF AMP
with my HT404X as a driver.

Thanks for any suggestions.

Can you please reply direct to me in addition to posting to DIGEST?
Currently, I cannot receive any QRP-L DIGEST via email.
Resubscribing did not help.
Emailings to Jim and Chuck about this were never answered.

>Anyone built these kits and offer an opinion one way or the other?

I don't have a very high opinion of the Ramsey kits. They have a number
of design defects, and are difficult to tune up *correctly*. You really need
a spectrum analyzer to avoid winding up with a comb spectrum. The
TenTec 2m kit is *much* better if you're interested in building a kit radio.
If you're more interested in saving money, then converting a land mobile
radio is probably the way to go. A GE MVP can be had for $25 to $50,
and is a heck of a better radio than the Ramsey.

You could also build up the Hamtronics Tx and Rx strips. Their new
synthesized models are pretty good. But you'll wind up spending as
much as you'd spend for a used Yaesu/Kenwood/Icom. Building kits
really doesn't save much money, but it can be a fun experience.

> By the way, the use of lower sideband on 80 (and also 40 and 160) is an
> anachronism. In order to simplify things in the early side band rigs
> they used a 9 MHz IF with a 5 MHz VFO. This permitted the use of lower
> sideband on 75 M (9-5 = 4 MHz) and upper sideband on 20 M (9+5 = 14 MHz).

This is a popular myth, but cannot be true.

Assume that the 9 MHz generator is USB only. 9 MHz USB + 5 MHz is 14 MHz USB. However, 9 MHz USB - 5 MHz is 4 MHz USB. Therefore there is no sideband reversal at all at 4 MHz.

You can test this by doing the maths but substitute 9.001 Mhz for 9 MHz. The output frequencies will be 14.001 MHz and 4.001 MHz. Thus it is clear that there is no transposition of frequencies, as would be required to get a LSB signal.

The only way you can achieve sideband reversal would be to subtract the SSB generator's output from a HIGHER frequency VFO. For example, a 5 MHz USB generator, when mixed with a 9 MHz VFO would give 14 MHz USB and 4 MHz LSB. Again you can test this by adding 0.001 MHz to the SSB generator's freq and doing the sums - you get 14.001 MHz (ie USB) and 3.999 MHz (ie LSB).

3808. Iron pyrite crystal radio

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-23 00:00:00 UTC
From: veeduber@aol.com
Message-ID: <19981023172351.23551.00000160@ng151.aol.com>
Source record: 77844

To All:

I had some especially large & attractive iron pyrite (ie, 'Fool's gold'... FeS2). Bedded a hunk of it with sealing wax, drilled a neat hole, installed an IN34. Put a dot of solder on the leads. Sealed everything up with epoxy soz the solder-dot was flush with the surface.

Made up a classic-style 'crystal holder' from a ring of copper pipe with the usual pointed brass screw. 'Cat whisker' (usta be a safety pin) makes contact to one end of the IN34 lead, screw contacts the other. (Insulate the 'crystal' from the copper ring.

Nicely varnished wood base, coil wound on a Quaker Oats carton with #22 DCC. Round-head brass screws for terminals. 'Wiper' made from an old clock spring. High-impedance magnetic-type ear-phone...

Works pretty good... but all the old-timer's insist their's was better... able to pick up Chicago on a clear, old night... using galena an' all :-)

3809. VHF/UHF Receiver Projects

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-23 00:00:00 UTC
From: Jim Fielden <fielden@utkux.utcc.utk.edu>
Message-ID: <70qui4cca1@gaia.ns.utk.edu>
Source record: 77845

Hello All,
I'm wanting to build a receiver for 2 Meter CW. Anyone have any good designs(simple) that I could play around with?
In designing a 2 Meter CW Receiver, can I approach it just like a 40 Meter receiver, just make the right LC cal and solder it all together, or do I need something special for VHF/UHF?
Someday would like one for 440/902/1296, but to start off with just hope to be able to get on 2 Meter CW with Homebrew gear.
Receiver first, then I'll start worring about the Xmiter....

Tnx es 73

From: "Costas J. Spanos" <spanosNS@eecs.berkeley.edu>
Message-ID: <363105A0.4B26@eecs.berkeley.edu>
Source record: 77846

Anybody has a data sheet for the MRF497? Recent Motorola Databooks and the company web site do not carry it, but I have one of those and I am curious to find out what I can do with it. I would be grateful if anyone could fax the sheets to me (I am in the SF bay area), or if someone could simply give me some info on gain, power, IP, input and output impedance at 30MHz. (I know it is a 12V HF power transistor in the 50-100W range).

thanks

Costas / KE6SYN

For Sale: 2" X-Y scope modules. Compact design with cast and machined aluminum case, mu-metal shielding on CRT. Has internal HVPS and Fil inverter power supply that runs off a nominal 20-22 VDC source at a couple hundred ma. Also contains a pair of identical deflectin amplifiers (audio range) that allow low level tones to drive the vert and horizontal plates. All controls are preset, but available on the case via idenfied openings. Only external control that need be added is the intensity pot. Unit also has a signla sensor on the Vertical axis that will squelch the screen in the absense of signal on that channel (can be bypassed). All connections to the unit are made by a standard DB9 connector. Unit supplied with complete schematics and docs for making external intensity pot connection via terms on the DB9 connector. Unit was taken from depot pack spares for GRC-142 Ratt Van modems (tty tuning indicator) Like new condition with bright CRT. $75 post paid conus with docs as noted. I have a few units left.

>50-100W range).
>
>thanks
>
>Costas / KE6SYN

Hi Costas;

Nice device. I guess Motorola has discontinued it, though.

Gain: 11.2 dB @ f=50 MHz

Power: 40 Watts @ 50 MHz

IP (?)

Zin = 1.31 - j0.64 @ 30 MHz

ZOl= 1.80 - j0.39 @ 30 MHz

Pout= 60 watts w/ 4 w drive at 30 MHz, 12.5 VDC

Works great for 6m amplifiers, and would do fine at HF. Spec'ed from 25 to 50 MHz, so presume it was developed for low band VHF transceivers. I had gotten some when I worked for Heath. I still have a couple in the junk box, I think. The only difficulty is getting the heat out of the TO-220 package, and grounding the emitter really solidly. Good luck.

John...

I would have to take some issue with that! I am using a modified
A&A Engineering spectrum analyzer. With some work on the CATV
module, and a new IF chain using the AD606 log IF chip, it gives 80
dB display range and about 70 dB or better dynamic range. For what
it cost, I am very satisfied with it.

Pete

>>>the 4CX250 passive grid excitation is not suitable with this tube (to be
>>>frank, I have not seen a 4CX250 design yet with passive grid input, they
>>>all use tuned input circuitry).

Why should the internal structure of the tube be a consideration? RF drive
is rf drive.... The tube can not determine if the drive voltage is being
developed
across what is basically a 50-ohm load resistor, or a high impedance LC
circuit.

I believe these tubes run about -45 volts bias. Using 50-ohm resistor to
set the
input impedance should provide a good match to most low-power exciters.

Peter

The input impedance can be set by the use of swamping resistors across
the tuned circuit, or set to 50-ohms by using a 50-ohm termination
resistance
at the grid.

One final comment (no pun intended!!)
The 4CX250 has rather poor IMD performance.
If you can find some 4CX350 tubes, they will
perform better in SSB service.

From: Reg Edwards <G4fgq.Regp@btinternet.com>
Message-ID: <01bdff54$3fbb09c0$LocalHost@default>
Source record: 77769

Program RJELINE3 is now available.

The lucky user -

Designs the xmn line by entering Zo, conductor diameters, VF and line length.

Connects his own terminating impedance R + jX or, if preferred, in the parallel form.

Computes input impedance Rin + jXin, also parallel form, also modulus and angle.

Computes reflection coefficient and VSWR of Zin with respect to 50 ohms.

Computes line loss as a percentage of input power due to skin and proximity resistance, and dielectric power factor.

Special facilities to assist xfmr designers -

Rapidly vary line length over any large range in 1mm increments, up and down, by depressing one or the other of two adjacent character keys, while observing behaviour of Rin and Xin. In particular, watching for reversals in the sign of Xin which correspond to minimum values of Rin, and minimum VSWR versus 50 ohms.

Similarly, rapidly vary line Zo in 1 ohm steps, up or down.

No point in varying frequency because in practice the terminating impedance would also change with frequency.

Actual rapidity of sweeping will depend on your processor clock rate. This program is a real number cruncher.

Download RJELINE3 (about 50 K-bytes) in a few seconds. One file only. Not zipped up.Will not clutter up your hard drive with a lot of rubbish. Can be run immediately.

Actually it can be run at the website without downloading but this may affect your phone bill. Download and amuse/educate yourself at your leisure.

While you are there, if you havn't already obtained a copy of Dipole1 then please help yourself. It will do a similar job except that the line is terminated by the dipole feedpont.

In a message dated 98-10-23 20:43:56 EDT, Reed Park wrote (re: Iron Pyrite Crystal Set):

<<
Sounds like a nice project. I have been trying for a long time
to find ROUND Quaker Oats containers. We up here in
Canada no longer have access to them. They stopped using
the round containers many years ago. Lucky you !. A crystal
set just doesn't look the same (or work the same) when the
coil is wound on a rectangular box. YUK !
>>

Reed,

Go find some brown paper. Paper bags will work but you gotta iron them flat.

Go find a bottle or jar the size of the coil you want to wind.

Tape some waxed paper around the bottle. Three or four layers. Don't tape the first the layer to the bottle, just wind it on. Secure the last wrap with a bit of tape. Keep things tight.

Wrap the brown paper around the bottle, smearing a bit of glue here & there. Not a lot. But run a continuous bead of glue when you start wrapping and when you finish. The more layers of paper, the stronger the form will be.

Let it dry.

Go find a can that will hold your finished coil form. Thin some varnish -- any kind -- about 1:1 -- really drippy.

Pull the paper off the waxed bottle -- the waxed paper will let things slide off.

Put the paper coil form in the can, fill with dilute varnish and let it soak. The more layers of paper, the longer it has to soak. Then hang it up to dry. Takes a while. Watch out for the drips.

Once the coil form is dry, PAINT IT WITH MORE VARNISH. Use it straight this time. Two coats, a couple of days apart. Anything more than two coats won't help.

The result is a reasonably sturdy coil form that will not absorb moisture, stays pretty close to frequency.

Variations on this theme: Use saran-wrap (plastic food wrap) over a CARDBOARD cylinder, wind the 'coil-form' from cloth or fiberglas, saturated with resin or

glue. (Weldwood 'Plastic Resin' wood glue and old bed sheets works fine for this.) Let it cure. Then pierce the Saran-wrap and throw the thing in a bucket of soapy water and go do something else. In a couple of days the cardboard will turn to mush, leaving you with a nice coil form.

Air-wound transmitting coils of any pitch, diameter and wire size, may also be made at home except you'll have to make some tooling. The basic idea is to made demountable wooden cylinders -- slabs of wood fastened together at an angle then turn to a cylindrical form on a lathe -- which are grooved to take the Lucite or plastic rods onto which the wire is to be wound. A router is used to groove the cylinders, typically at 90 degree intervals but more is better with larger coils.

The form is mounted in the lathe, the feed adjusted for the desired pitch, the wire tensioner adjusted for the diameter of the coil. The lathe is turned on with the feed-screw engaged and the coil winds itself onto the form.

With the lathe turned off and tension still on the wire, a high-output heat-gun is used to soften the plastic rods. The tension in the wire will cause it to imbed into the rods. Make sure it imbeds deeply enough and that the plastic flows back over the wire as it imbeds. Once the plastic has cooled the wire is cut, the form removed from the lathe, the fasteners removed from the form and the form driven apart, leaving you with as nice a coil as anything Barker & Williamson ever sold. Kinda slow going -- one or two a night -- but fast enough for most folks.

9MHz xtal filters were not applied before 1964, and decision to use LSB
on 160/80/40m and usb above was made much earlier. Earlier rigs were
phase-type and some used 455kHz mechanical filters, later surplus FT241
and FT243 filters*) were used, and other frequencies like 5.2MHz, but
9MHz filters were late, believe the German KVG (XF-9A) made some early
9MHz filters.

*)they were usually made for some odd frequencies dependent on most
commonly available xtal frequencies.

First you have to build a good 20dB gain low noise 2m pre-amplifier,
BFR90, BFR91, BFW92, BFT66 (bipolar) or BF981 are some great transistors
for the project.

Then the easiest solution is a direct conversion RX using twin diode
antiparallel mixer, 1N4148 is ufb. Oscillator for 144MHz is 72MHz. It is
fairly easy to have 7dB mixer noise factor. Then the audio is just as
for 40m band, but you must have lower-noise audio amplifier because it
is possible to copy a 10dB weaker signal on 2m compared to 40m.

bilateral mixer for 2m dc-RX

2x1N4148 (anti-parallel diodes)
|->|-|
A----| |-----|-|<-|-|----|---> passive audio
| | | | lowpass-filter
--- 1nF 0.1uF
| |
1turn link on 72MHz ---------gnd
osc output coil

must be read as text-file, or using netscape 3.04

'A' is tapped 1 turn from cold side of input coil (75 ohm)
Input circuit is 5-6turns 5mm dia 18swg tinned copper wire,coil length
6mm , tuned with 20pF trimmer capacitor. The tuned circuit should be
connected pre-amplifier output circuit. Output from a BFR90/BFT66 RF
pre-amplifier should be coupled to the coil via 1nF ceramic capacitor at
1 turn from cold end.

I have also tested this type of mixer in
14/144MHz bilateral mixer
40/30/20m DC receiver with 0.1uV sensitivity

1N4148 mixer diodes are better than hotcarrier diodes for HF mixers, and still good for 2m, but max frequency limit is around 150MHz.

3841. Motorola 280W UHF Power amplifier on +14VDC?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-24 00:00:00 UTC
From: LA8AK@online.no
Message-ID: <3631ac11.64111196@news.online.no>
Source record: 77775

Hi
Bought a 70cm 280W surplus PA from OE2WIM. TTE1622A, circulator (1,3dB)
at the output TTE1482A. No manufacturer mentioned, rumours says it is
made by Motorola. They were used in Austria.
RF power devices are marked: Pre-Driver: M1107 185 8745
Driver and PA (2*): 185 11L60 8831

wonder what the power devices could be compared to, believe M1107 and
11L60 indicates sort of manufacturer's code for the devices.

3842. MC3403P=LM324N? Direct conversion CW/SSB project

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-24 00:00:00 UTC
From: LA8AK@online.no
Message-ID: <3631abff.64093493@news.online.no>
Source record: 77776

Please verify that MC3403P=LM324N, S53MV used MC3403P, but I have only
CA324 and LM324.
It is for a direct conversion transceiver project, so I don't want to
use too noisy IC's.

I don't understand why you did some of this. What's the function of the
pyrite? What's the function of the cat whisker?

I built (years ago) crystal/fox-hole radios using galena or razor blades
and cat whiskers. So I think I know the function of those items in
those radios. But you're also using a germanium diode? Why?

3844. Circuit for Low power amplifier for 12cm-band???

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-24 00:00:00 UTC
From: Slawomir Dabek <dabek@muenster.de>
Message-ID: <3631F2FE.4A4480ED@muenster.de>
Source record: 77778

Hi,
I need a circuit for an amplifier for the 12cm-band. The accurate
freyency-range is 2400MHz - 2483MHz. The input is about 7-13mW and
the output should be min. 500mW.
I would be also happy if someone could tell me wich is a good antenna
for this band.
I need this all for a digital-tranmitter to get over 3km.

Many Tnx,
S. Dabek

One way to measure both the resistance and reactance of your system is with a bridge. I use a simple noise bridge for antenna and feedline measurements.

The resistance and reactance of an antenna-feedline combination will vary with frequency, and it may be affected by weather and other such uncontrollable variables. So you make the measurements at a frequency (or several frequencies) that interests you. Then the reactance can be converted to a capacitance (negative reactance) or inductance (positive reactance) using formulas in the handbooks:

C = 1 / (2 * Pi * Freq * X)

or

L = X / (2 * Pi * Freq)

A typical LCR meter won't make the measurement you need because it doesn't use the frequencies you're interested in -- it's basically a DC measurement.

Hi Mark,

Luckily, no. I am on a mountain top 35mi NW of Chattanooga. I plan to use the rig as a back-up at home.

But I appreciate the info. You make #4 that has said the same thing, but that it's fixable with external filters.

PS: You in the Bucheye? I am originally from Cleveland.

The CATV tuner is actually quite good for a VHF/UHF spectrum analyzer...probably better than what the vast majority of homebrewers can make themselves. A modern CATV tuner (from a set-top converter) has to be able to handle an input load of 70-80 TV channels running at equal levels, at frequencies up to 550 or 750 MHz, with all spurious and distortion products suppressed almost 60 dB!. This is quite a feat, and these tuners actually outperform some commercial spectrum analyzers.
The CATV tuner uses an "imageless" up/down conversion technique, much like modern HF communications receivers. TV tuners, on the other hand, use simple single downconversion and they have poor image response and tend to produce more spurious responses.
There are stringent FCC regulations that drive the performance of CATV tuners...I don't think there are comparable standards for TV tuners. The only possible problem with the CATV tuner (or the TV tuner for that matter) is that the 1st local oscillator has a very wide tuning range, and operates at over 1GHz. They tend to have inadequate phase noise performance for very narow band signal analysis, but I haven't seen anyone attempt to build a homebrew analyzer that would stress this weakness.

I would definately recommend the CATV tuner for a VHF/UHF homebrew analyzer.

I have had some great comments from all you people re
making coils and just xtal sets in general. Nice to see that
there are so many people with similar interests.

BUT

Most of you missed the point. The reason I was looking for
Round containers from Quaker Oats, is up here in Canada,
they only make rectangular ones. I was looking for round
ones to be more authentic in my project. I wanted to build
an authentic looking xtal radio as the ones I used to build
away back in the 1950's. It was built on, and in a round
Quaker Oats container. About as close to that as I can do
up here, is to use a round mailing tube, or plastic pipe
and put the cardboard from a rectangular container over it.

But what the heck. I sure got some great ideas from those of
you that did reply. Many thanks again.

Regards
Reed

3865. Re: CB to 10m CW conversion?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-25 00:00:00 UTC
From: James Pennell <jpennell@ix.netcom.com>
Message-ID: <70tv00$gdd@dfw-ixnews9.ix.netcom.com>
Source record: 77711

Some years ago, I worked at SBE and I've seen a LOT of modifications to the radios.

I've done both AM to CW conversions, and SSB to CW.

I'd recommend starting with the SSB... The conversion is MUCH simpler. In fact, many of the synthesized radios use premixing in the synthesizer and, usually, it's possible to move the VCO to the high side of the premix oscillator which will shift the radio to somewhere in the 10 meter band.

You will have to reverse the sense of the SYNTHESIZER somehow to compensate for inverting the premix frequencies.

One way is to reverse the varactor diode itself, adding a blocking capacitor and a pullup resistor.

The other way would be to reverse the output of the phase comparator which can be hard to do.... The varactor is usually simpler.

Good luck,

Jim N6BIU

That's correct. This is the scheme used by the B&W 6100 transmitter for example. It is necessary for the VFO to be above both the band of interest and above the IF for sideband inversion to occur. This is obviously the case with use of a 455 kHz IF and high side VFO injection, and it is also the case for a 5 MHz IF and a 9 MHz VFO on 80m as was done in the B&W 6100. On 20m, the latter method yields a right side up sideband, so you can have LSB on 80m and USB on 20m without changing the suppressed carrier modulator oscillator.

Radios using a 9 MHz IF came along later, and had to change the IF suppressed carrier oscillator frequency to switch sidebands for LSB operation on 80m and USB operation on 20m when used with a 5 MHz VFO. In other words, that scheme doesn't give you sideband inversion.

It doesn't require years of experience to do the math, Cliff. He's right,
you're wrong. The radios which did sideband inversion had a 5 MHz
IF and a 9 MHz VFO (example, B&W 6100). Rigs with a 9 MHz IF and
a 5 MHz VFO don't do sideband inversion (example Galaxy V MkII).
The latter *automatically* switched the carrier oscillator, as most
modern rigs do, when you went to 80m, but switch the carrier oscillator
it did in order to get LSB.

Mechanical filters derive their selectivity from the mechanical resonance
of coupling elements. In a sense, a crystal filter is a mechanical filter
too, but the term is generally used only for filters made from rods or discs
of material which are excited to vibrate by a transducer, and the vibrations
converted back to an electrical signal by another transducer on the other
end.

looking for specs per class of opperation. would like to find out what these tubes would need as far as grid voltage/current verses plate voltage/current opperating in class B or AB.....got an idea these tubes would make a dandy linear amp for hf.
i know they will need some bias as they are certainly not zero bias types! was able to find out these specs: plate volts max..4kv, plate current max..550mils.
also know filament is 10volts at 10amps. now the question is does anyone out there have a factory data sheet? well any help will be appreciated, thanks & 73..

Source record: 77725

Does anyone know how to make a wideband input/output matching networks for a class C amp for vhf? I mean i want it to cover about 20-30 mhz...lets just say around 130-160mhz. I have built class c amps before using MRF transistors, but a minor frequency change requires tuning. Someone told me to use many "jumps" and to try not to use series trimmer caps, but didn't give me details.

I need information on a Collins mechanical filter, or an address to try at Rockwell for a data sheet. The filter (actually, I have two identical units) is plastic cased, rectangular, 7/8 by 2-1/2 long, and has a part no. 526 9700 030 on the label. A customer no. F 256 Z 3F also is present. I'd like to use them in a project of some kind if the specs are reasonable. A search through a fairly complete listing of filter numbers on the web did not turn up these numbers.

Swan 350 has 5174.5MHZ (5500 for 350C), NCX has 6020kHz xtal filter
(first IF 3500-4000kHz variable), you really cannot compare these two,

only for 80m. See: RSGB/G3VA 'ART' 6th edition.

The list'o'PLLs at this site says the C5121 PLL is not modifiable.

In general, none of the Realistic CBs made in the last 10 years has
a modifiable PLL. I suppose you could build a VFO and completely replace
the PLL and associated circuitry, but that sorta defeats the purpose.

3891. SSB mystery

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-26 00:00:00 UTC
From: af389@lafn.ORG
Message-ID: <36348CFE.43A3DF94@lafn.org>
Source record: 77652

HI,

Anyone have an idea why adding an MMIC preamp ahead of a convertor,
receiving 20M SSB signals, causes modulation of received SSB
signals to be distorted but added gain works FINE with AM signals?

My friends actual email note follows:

> Yesterday I made up a 1651 pre-amp with FET input to be used as an RF
> stage ahead of the low band converter. The results of the experiment
> created mixed feelings. First, the pre-amp worked and provided the
> expected gain. However, when using the pre-amp at 14Mhz SSB,
> the gain of the pre-amp became critical relative to
> signal/modulation distortion. Any gain above about 12dbe (two S-units)
> created distortion even though the signal level would indicate higher
> than without the pre-amp.

> Is 50 ohms from preamp to convertor.

Add to that -- AN955/D, which most definitely is available on MFAX.
This shows EXACTLY the plan you are asking for -- 20 MHz bandwidth, 30 watts,
at 130-150 MHz.

A theoretical discussion is provided in AN721/D (use MFAX), and could
be applied to the technique described in AR305.

Motorola also has a compilation of RF app notes, but I don't have the number
and haven't seen it yet....I believe RF Parts sells it for $20 or something
but MOT will provide it free if you know how to ask.

The twin diode mixer below looks similar to the one I built with elevated microstrip from a 73 article from the late 70's for microwave down conversion.

I modified it to convert 2.5-2.7 GHz MMDS down to VHF-lo tv. I calculated the LO to be around 900 MHz... It actually worked.

I have been using them for many years, with many problems! They are convienent, but low security and reliability. The computer interface is worthless, if you are a ham and running more than 100 watts, 'cause the rf wipes out the program! I have motion detectors outside that turn on all of my perimeter floodlights, and i love that feature(except when the neighbor's cat sets it off at 2:00 am!).

I recently picked up a couple of Dovetron MPC-1000R-II "Regenerative RTTY Terminal Units". Anybody familiar with these? I sure could use a copy of the manual for one if anybody has it.

Looks like they have switchable time constants for the post-detection LP filter, so I am guessing one would make a nice analog front end for my PK-232 TU. Comments?

I had the exact same problem with my Icom V21AT after it sat without being turned on or charged for six months. Look in the owner's manual and there is a key sequence of I think four keys that you hold down while sliding on the battery. That will bring your radio back to life. Let us know what happens....

Good Luck,
Steve

Marv: That's a tough one. I was looking for these crystals when I was building a homebrew receiver. VERY hard to find. Jan Crystals will make them for you, but at 75 dollars each. Ouch. I did manage to locate a couple of old military surplus rocks (donated by a very kind fellow ham) but found that these old crystals do not age well - mine were not working. Good luck. What do you need them for?

I am looking for a couple of 3SK48 dual gate fets. These are used in the front-end and mixer of an older Icom IC-RP3010 UHF repeater. Maybe there is similar device that will work as well or better?

Currently sensitivity is a bit low on the receiver. I am also considering an outboard pre-amp, but have had bad luck with pre-amps on 2-meter repeaters. They are wonderful until the transmitter keys. Maybe the results will be different with the 5 MHz split on UHF?

Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,sci.electronics

I've recently acquired a Panoramic (Singer) Universal Spectrum Analyzer Model MF-5/GD with plug-in CA-5/GD. Looking at the data plates I get the impression it was spec'd by the USAF. I also have a Panoramic (Singer) MF-5/CA-5-1 ALFRED Spectrum Analyzer, similar to the above, the manual of which bears NAVSHIPS NO. 0967-302-2010, which suggest USN spec.

I'd like to hear from anyone who owns/operates or has used this equip't, esp in USAF or USN service. I'd also like to find out what the significance of the "/GD" suffix is.

Thanks,

John Mackesy VK3XAO

Slide a fully charged battery about 1/2 way onto the radio, press the
Function button. While holding the function button slide the battery
the rest of the way on. Now turn on the radio. This information is
shown I think on page ii in the center column of your owners manual.
under CPU starting function

International Crystals in Oklahoma City made xtals near 455 kHz for me for $25 each. I use two of them in a BFO circuit for CW and SSB, so the exact frequencies are offset from 455 kHz.

Use this procedure:

When you receive a "Roger Beep" on your radio....

1. Place radio on floor.
2. Hit with 6-lb sledge hammer.
3. Repeat until beep is no longer heard.

3917. Help on Hamtronics kit R-100 receiver

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-27 00:00:00 UTC
From: KD1YV <jimkd1yv@snet.net>
Message-ID: <36368FDE.C7C05ACC@snet.net>
Source record: 77600

Further to this post, I should have stated that the R-100 is in repeater service. I did a scan on DejaNews and found several negative comments about Hamtronics when used for repeater RX (although nothing about this specific model.)

Is this a hopeless situation? If so, we'll probably have to break down and buy a different receiver. However, since this is for a school club, we are on a limited budget.

I can not remember the number oa a chip I used to decode the 16 outputs of a dtmf chip. I think it was maybe a mc 14158 or something like that. Can any one help? It takes the four outputs of the decoder chip, and converts them to 16. They go high when a tone is detected. I know it is a cmos chip. Help please Mike KH6VT m_flanagan@yahoo.com

Try the RSGB publications.

I thought that 23cm was popular in Europe and Great Britain, so you
should be able to find some info.

You might also try www.downeastmicrowave.com. They sell kits and all
kinds of parts for all VHF/UHF and microwave bands.

After reading these posts, I searched around in my stuff and found some beautiful little full color charts that were printed years ago for a local technical college showing the resistor color codes, and tolerances.
If anyone would like a few, stop by and I'll give you some, or mail me a dollar (for postage and handling, sorry, I can't do it for free) and I'll send you four of these little gems from the past while they last.
PLEASE print your address LEGIBLY!

These really are kinda neat...

I bet if the COR circuit was properly enclosed in an RF tight enclosure
and included adequate bypass caps the instability would go away.

I found them to GENERATE a lot of RFI, making it unacceptable for me.
IMO, X-10 doesn't coexisit well with weak signals.

I have a question about the crystals used in crystal filters found in many superhet design radios: what kind of crystals are they using? Are they the typical crystals that are used in oscillators? I might have to resort to designing one for my 80m transciever, and I know that there exists many 1MHz crystals, so I am wondering if I can use these kind of crystals for the design. I have a couple of articles on designing crystal filters, but I haven't found one that talks about the restrictions on the filter. I'm not looking for anything real fancy; just something that works!

Thanks for the advice.

Take a look at Wes Haywards home page at
www.teleport.com/~w7zoi

(it's case sensitive)

Regular crystals work, real filter crystals are normally "backplated", an extra coating of the conducting plating on the crystal face. This tends to destroy close by resonances in the crystal improving the filter. In practice, excellent filters can be made with "ordinary" oscillator crystals although I'd tend to shy away from crystal frequencies of even MHz, too easy to get WWV pickup on 5 MHz units!
Hayward has some beautiful design software in the back of his book "Intro to RF Design" that takes all the math and does the crunching for you. I made a super 18 pole design with it and it worked perfectly the first time I cranked it up. If you do it like he says and it doesn't play, take a look for a cold solder joint, that's about all that can be wrong.

Good Luck

Hopefully they have improved their reliability. Several years ago I had
many units in use around the house. I had a lot of trouble with the light
dimmer modules going out. These are the modules that replaced your conventional
'in the wall' light switch. I believe I replaced four units in the first year.

We also had some trouble with the various modules triggering on and off during
thunderstorms. As I live in north Texas, this problem was just not acceptable
with our numerous storms during 'tornado season'.

Good luck!

3931. RF capacitor question

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-27 00:00:00 UTC
From: sshumway@workgroup.neo.lrun.com
Message-ID: <NEWTNews.909502948.31728.sshumway@workgroup.neo.lrun.com>
Source record: 77674

Hello, and thanks for reading this.

I have several capacitors that I have acquired out
of junk equipment over the years. I'm wondering if
they would be any good for use in an antenna tuner.

Advice and comment would be welcome.

Cornell Dubilier
Type 9 H
0.0004 uFd
Working voltage 2500 VDC
Test 5000 VDC

The part that has me puzzled is the VDC rating. At
least a few of these came out of some kind of old WW II
vintage Navy RF gear. They don't seem to be polar (at least no
polar markings that I recognise as such).

Will I get away with using them in my home brew antenna tuner?

Thanks in advance for any help you can offer.

Steve Shumway

3932. FS: Sams CB Manuals (for CB to 10M conv help)

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-27 00:00:00 UTC
From: Brad Thompson <Brad_Thompson@pop.valley.net>
Message-ID: <3635E646.5AD5@pop.valley.net>
Source record: 77675

Converting an old-time CB to 10(or maybe six) meters)? It's much easier when you have a schematic, parts list, and component-layout drawings on your bench.

I'm offering the following out-of-print Howard W. Sams' Photofact CB Radio Manuals for sale:

Volumes CB-1 through 33 (inclusive);
Volumes CB-40 through CB-43 (inclusive);
CB-62;
CB-76

These manuals cover a period from November, 1961 to November, 1975 and include both tube-based and solid-state transceivers. All manuals are in at least good condition (pages are intact and unmarked; wraps show some creasing, chipping and finger soil), with most in very good condition. All smell slightly of tobacco smoke (the previous owner's).

Price: $7.50 each (buy four volumes for $25.00).

Add U.S. book-rate postage: $2.00 (1st book) plus $1.00 per additional book; or U.S. Priority-mail postage: $3.00 (1st book) plus $1.50 per additional book. Add $.75 for insurance on shipments over $20.00.

Overseas buyers: tell me your location and I'll quote postage.

You can reserve the manuals of your choice for ten days via e-mail or a phone call.

We accept payment by personal or cashier's check or money order drawn in U.S. dollars (please make these payable to "Brad Thompson").

If it's more convenient for you, we also accept payment for books via certain credit cards (Visa, MasterCard, Novus and Discover).

Our merchant credit-card provider recommends that credit-card customers not send their card data over the Internet, but fax or phone the numbers instead. We maintain a full-time fax machine at the fax number shown in our dealer description.

However, many of our customers do use the Internet by splitting credit-card data into multiple e-mail messages, spelling out the digits (e.g., one three...), and/or inserting nonsense words (e.g., one dog three biscuits...). We have no idea whether these methods guarantee any security at all, or indeed whether a security problem actually exists, but we'll pass along our provider's concerns.

In case we're unavailable, we maintain a secure telephone-answering machine to record card data plus any messages; don't forget to state your name, your daytime or evening phone number (in case we need to call you), the title of the book you're ordering, and your shipment preference. Please call between 9AM and 9PM, East Coast time.

I couldn't help but notice that this is the list of crystals used in the transceiver project in the Build Your Own Intelligent Amateur Radio Transceiver book. In case you don't find a better deal and if any other builders are looking, the 4.19304-, 9.8304- and 72-MHz crystals are available from Mouser Electronics. The 76.1931-, 67.8044- and 9.831396-MHz crystals will probably have to be custom ground by firms such as Jan Crystals or International Crystal Mfg. Co.

I will keep that in mind. Right now, I am going to inspect the possiblity of a LC filter--my prodject partner designed one that looks promising, and if I center it low it enough, it might have enough attenuation to work. Thanks for the advice.

I would like one my self, but they are not published any more.

Saw a web sight once for a BCB listeners club (North American radio Club?).
Not sure about the name, and don't remember the web address either.
Anyway, they publish a listing of all AM stations, including the low
power ones.

If someone else here doesn't come up with the web address for you, just
try poking around on the net and you will probably stumble across it as
I did.

>W4ZCB

One idea I have been kicking around, for a 160-80-40 meter receiver is to use a 10.7 MHz first IF with a FM style crystal filter (30 KHz selectivity or so. VFO would then be from 12.5 to 18.2 MHz. Major selectivity would then be in the second IF stage, perhaps using a Weaver style circuit (thats a phasing type SSB, receiver folks).

Interesting idea. One thing to check first is the selectivity (I think
that is the proper term) of the filter--I've beeng working with the
455kHz version, and it just doesn't seem to have much of a roll-off for
attenuation. There are probably better filters (the AM 455kHz kind, I
mean) than the ones that I have, but I would keep that in mind.

a design was shown in HR late 70's, some rumour said that such mixers
did not perform as well as desired. G3VA published some different RA3AAE
mixers, of which I believe some versions were not good. LA7MI - a keen
experienced homebrewer copied one and had 15dB NF on 80m, so he was,
later surprised to measure one of mine, hi. Later DB6NT used similar
design in his famous 144MHz to 24GHz transverter, S53MV in his wellknown
direct conversion ssb transceivers for 1.3/2.3/3.456/5.76/10.368GHz.
It is important to keep all ports at low impedance for other frequencies
than which have to pass.

From: parkerp@alphalink.com.au
Message-ID: <715afj$f71$1@nnrp1.dejanews.com>
Source record: 77684

This is to advise that Peter Parker's Home Page, that contains information on QRP (Australian QRP Home Page), homebrewing (Peter Parker's Projects Page) and for the beginner to amateur radio (Novice Notes Online) has changed URL.

The old URL was http://www.pcug.org.au/~parkerp/

The new URL is http://www.alphalink.com.au/~parkerp/index.htm

You can get direct to the QRP page by replacing "index" with qrp, and to Novice Notes Online by replacing "index" with nonline.

This page is one of the most extensive on the web with articles on most aspects of amateur operation. Feel free to add links to it from your own webpage. If you already have a link or bookmark, please change it to the new URL above. As I no longer hold the VK1Pk callsign, references to this should be changed to VK3YE.

73,

Peter VK3YE (ex VK1PK)

3943. How do you tune a trap antenna??

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-27 00:00:00 UTC
From: &NM7U <&NM7U@hevanet.com>
Message-ID: <36362442.4C076E1D@hevanet.com>
Source record: 77686

I put up a trap inverted VEE for 40/75 about 10 years or so ago. The
SWR has gone above 3:1.
No problem...so I thought.
I shorted out all the traps. Got low SWR at 4.6 MHz. That should
verify the coax and the balun.
I removed the coax-cable traps and checked them with the grid dipper.
Right on frequency.
Ok, so the wire stretched. I made sure both sides were the same length
and started changing the length
of the 40m wire. I can move the frequency around a little, but the SWR
is still 3:1.
At the resonant frequency of the trap, the rest of the antenna is mostly
decoupled.
Off resonance, either side, the effective antenna length is very much
longer. So the effective wire length
including the end effect of the trap has to be correct at exactly the
trap resonant frequency.
The wire "looks longer" either side of resonance. I can't tell if the
wire is too long or too short.
What's wrong with this picture?
I've climbed all over the roof cutting and trying until I'm blue in the
face. Is there any predictable
way to trim a trap antenna?

miker

I'm not sure about the ratings in VDC...
If you want to compare it to other RF Caps, try
http://www.rfparts.com
they have a Great Online catalog for you.
If your cap is a "Doorknob Capacitor", rated at 2500 v it's fine, if you need the value.
Usually, you can add capacitors to "Pad" (add extra capacitance) & make them switchable into the circut.
Any other questions, just ask....
I have some spare parts, (Doorknobs, BIG Variables, BIG Variable Inductors & other stuff....

Joe,

I've been using X-10 units, 5 of them the original versions and a few of the newer Radio Shack units for about 10 years. I've run between 100w and 1kw with no noticeable problems. Lost 2 of them from lighting spikes (a lot of other things blew with them :-( ) Other than that, they have worked very well. I have not used them with a computer controller.

One thing you could run into is a problem with the house wiring. Most if not all installations these days split the three wire entrance feed so you could find that with the controller plugged into one leg it might not connect with the switch modules on the other leg unless you have a 220v appliance on somewhere to provide a bridge. Sometimes, I've heard, the the transformer feeding your house is close enough to take care of this.

What I've done is to put a 0.1mfd 245vac capacitor across the 220v line at the electric drier outlet with a 15amp fuse on each side. You should use a cap approved by UL for 245VAC service to be safe.

I wrote this up in the QST Tech Notes several years ago, but I can't remember the issue.

3948. Re: How do you tune a trap antenna??

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-27 00:00:00 UTC
From: aci6@aol.com
Message-ID: <19981027170614.12251.00000334@ng30.aol.com>
Source record: 77691

Hello,

If I were you I would substitute a dummy load for the antenna and check the SWR of just the feedline and dummy load. If that is OK at ALL HF frequencies, I would check the balun (if you are using one) - you could just remove it and try the antenna without it.

You didn't say if the SWR was 3 to 1 on 75M and 40M or just one band. But, the way to tune it is to assemble the antenna with all pieces in place. Then tune the 40M portion (the wire between the traps) for best SWR. Then tune the wire outside the traps for best SWR on 75M. You may get a little interaction when you tune 75M but it shouldn't be much. This method has worked for me more than once and it is the method given by Reyco for their traps.

If all else fails, check your SWR meter with a dummy load . . .

Good luck,

Bill

3949. More questions about crystals

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-27 00:00:00 UTC
From: Shawn Upton <supton@eece.maine.edu>
Message-ID: <3636485C.6488@eece.maine.edu>
Source record: 77692

I've been trying to figure these little buggers out... I understand (or am starting to) the idea of what is going on inside of them, but I am unsure of how they are being used. Right now, I am trying to build an IF filter, and for a first design, a narrow filter will work fine. I've looked at some other designs that I have (ARRL book, ARRL QRP book), and I see a couple of designs that use them directly as filters, but with capacitors shunting the crystals to ground. [The design looks like a cap to ground, and on that node is the first crystal, then on the output node of the crystal is another cap to ground, and the input of the second crystal. The second crystal is terminated in a cap parallel with a resistor to ground.] Why? The design I'm talking about, or at least the first place that I have seen this, is the 40-40 (or SW40) design.

So, when I go about making my own filter, 1) what size caps do I need 2) what kind of input/output resistances should I use? I want a filter either at 450kHz, 1Mhz, or 8MHz, whatever would work, my VFO/LO can be moved w/o a problem. I just need to be able to get the 80m band.
Thanks for the help.

3951. Email reflector for buying/selling tube type gear

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-27 00:00:00 UTC
From: Eugene Rippen <soundval@foothill.net>
Message-ID: <715het$ma3$1@ns2.foothill.net>
Source record: 77694

For those interested in buying or selling older ham gear,
tube type items and accessories, including homebrews,
there is an Email Reflector called baswaplist.
It is FREE. It has about 720 subscribers
It is very limited to certain purposes.

IT IS FOR buying, selling and swapping of :
Tube Type and Older ham equipment, parts,
accessories, and manuals and catalogs.
Books and periodicals concerning tube type
equipment and older ham gear.
Single one time announcements of swap meets.
Though, NOT including who will attend or what
specific items will be offered.

IT IS NOT FOR:
Discussions, other than very SHORT and very
general discussions of pricing, packaging and
shipping.
Commercial advertising other than for the sale
of specific PRICED items of the nature described
above. In other words, no institutional type
advertising.

LIMITED (but not totally banned) ARE:
Repetitive ads.
Offering of items for sale without prices.
(Very unique items may be
listed without prices.)
A reasonable amount of ads relating to Tube Type
Domestic Broadcast Receivers and Parts
are permitted.

Since this reflector has some subscribers that are newbys,
gear listed for sale should have the Manufacturer's
Name, Model and Short Description (Example:
"Gonset 6 Meter Receiver" "Heathkit SB-200,
80 - 10 M Linear" etc.) Please avoid using lingo.

As stated above, this list is very limited to those purposes.
A few examples of what is NOT to be posted:
Thank you's or apologies.
That an item has been sold.
That a computer has been down.
That a SPECIFIC listed item for sale has too high
or too low a price.

That an item may be for sale, but with no price
(unless the item is very unique).
That an item is being offered without a price
on another available list, or URL.
Referrals to E-Bay.
That someone is sick or dying.

TO SUBSCRIBE: SEND Message to: majordomo@foothill.net
In MESSAGE body SAY ONLY: subscribe baswaplist.
Then the email address of the sender will be added to the list.
To unsubscribe do the same, only say "unsubscribe" instead of "subscribe"

This list is CASE SENSITIVE as to the addresses of subscribers, that
is regardless of whether your ISP at your end is case sensitive.

Messages sent directly to me requesting subscribe or unsubscribe
may be ignored, or at best sent some kind of prepared boiler-plate
instructions.

I run the list. I am Eugene Rippen. Flack may be directed to me
at soundval@foothill.net.

Try using a tube type, audio output transformer and low impedance phones.
I haven't tried it, but an ordinary mains transformer should work too.
220V pri 12 sec or 110V pri 6V sec, should be about right.

I am (in a VERY minor way) an inventor. Maybe some of the folks here are, too, (maybe not so minor!) and have the same problem I did; how to get my ideas out into the marketplace. I could just go to manufacturers, hit ï¿½em cold, but I am afraid I donï¿½t have enough tolerance for rejection. I could make it myself, but donï¿½t have the marketing acumen that success would require. As often happens, the solution hit me all-at-once, a complete conceptï¿½ I, and many others like me, need a web-site that will showcase our work for industry.

It should include links to resources like patent attorneys, software and tools.

It will be vast, so navigation is a critical component.

It has to appeal to inventors AND to manufacturers.

It has to be cheap! We donï¿½t want spend a fortune on advertising, yet the costs preclude this being a hobby. (Maybe if I become an inventor in a major wayï¿½)

I want everyone to win; certainly industry needs ideas, inventors need industry and vendors of services, hardware and software need both.

I, of course, need all three. But I need input, too. If you have suggestions, ideas, or insight into this project, PLEASE POST! I want to get on-line with my site by the middle of November, and I want it to serve everyone in the best possible way.
TIA

One solution would be the TDK Semiconductor (formerly Silicon Systems) 75T202IP (previous designation from years ago: SSI-202IP). I don't have the spec handy so I cannot confirm the output arrangement.

This IC was the first monolithic DTMF decoder in the world. Previous solutions were extremely expensive hybrids.

3961. Suitable diode for UHF RF probe??

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-28 00:00:00 UTC
From: Graham Fitt <Graham.Fitt@btinternet.com>
Message-ID: <716lv5$1ic$2@mendelevium.btinternet.com>

Can anyone recommend a suitable diode for use in a UHF RF probe which will work OK up to about 500MHz. I want to use it with a homebrew FET Voltmeter. The junk box diode which I have experimented with runs out at about 150MHz. Ideally it should be a germanium device as these have a lower forward volt drop than silicon. My ancient AR books suggest the GEX66, which appears to be no longer available. The data sheets which I have looked at do not specify the max working frequency.

Many Thanks.

Graham G4ILN

Please do not post binaries to this NG. Either put them
in a binaries NG, or leave a pointer (FTP / HTTP) as to
where they may be found.

> All it is, is a simple Resistor colour code generator .. theres a couple
>of bugs in it in the fact you can enter just 1 band and get a result (But
>that's just plan silly)
Yes, it's certainly a silly plan to offer programs that you
know, before you send them out, have bugs in. This sort of
bug sounds extremely trivial to resolve.

> and if you enter black as the first colour it will
>tell you a value .. other than that it works .....
That's not a bug, <black>,<black>,<black>, is
the correct code for a zero-resistance, the sort
of dummy that looks better than a wire jumper, and
that can be auto-inserted by machine.

Most "junk box" OA and AA types of germanium diodes will go to about 500Mhz,
Maplin's used to do a good one for a few pence that went beyond a Ghz (I think
it was an AA119 ?). Even a 1N4148 or 1N914 should get up to about 1Ghz, the
best thing for the job is a schottky diode, Maplin's and Cirkit do them and
you will still get change from a pound ! The HP ones are vey good and go to
many Ghz. Mainline will almost certainly do these.

I did some tests with all sorts of junk box diodes above 1Ghz the results are
on my web pages, try http://www.xdinet.demon.co.uk/ARG/past.htm

Hope this is of use. 73 Chris Packman G6XDI

> building a real circuit.

Thanks, Phil and Brian, for your answers; I plan to use your stuff.
Another question: What kind of upper limit exists on the power that I
can put through normal crystals? No, I'm not trying to put a watt
through it; the test equipment here (at school) puts out a dBm for a
test signal, into a 50ohm load, so I'm worried about overdriving if I
just put the crystal into the spectrum analyzer (to measure the resonant
freq). The impedaince bridge, I'm not sure what that puts out for
power, but I'm sure that it won't be high enough to kill anything. And
it tests at 1kHz, so I should be able to get C0.

Thanks for the replys; I'll let you know how my design goes.

Farnell list some really interesting HP (285 series?) diodes in their Semiconductor Catalog. I can't remember the exact spec but Vf of 0.25V and designed specifically for power detector use (up to 5-6 GHz). Priced at about 60p each (MOQ 5). They are of course in SMD packaging. I'm tempted to get a few myself and see what kind of range they are capable of without biasing (I would guess that they can detect down to -20dBm or so with a normal high-Z VOM).
I bought some Schottky diodes (BAR28?) from Maplin a while back - they should work to 1GHz or so.

Graham,

Just to reinforce what Chris Packman has said, a Schottky diode (5082-2800)
would be your best bet.
I have a nice little design for such a probe which utilises the above diode.
Send me a mail if you require it.

Best regards

Dave..............

> had to add a line to the yaesu.ini file.

With my ft-50, I added teh line to my win.ini file (where my adms software
stores it's settings) AllowAnyFrequency=1. Here's what I have in my win.ini file:

```
[FT-50 Programmer]
DataDir=C:\YAESU\FT-50
AllowAnyFrequency=1
Calibrate=7636
Com=2
TemplateFile=C:\YAESU\FT-50\TEMPLATE.TPL
UseTemplate=1
```

Yes, it's not the ft-51, but hopefully it'll help.
However, even with it switched from a 0 to a 1, I haven;'t noticed any
difference, I still can't program cell, below 76mhz, or 200-299.995 mhz. I'm pretty
sure this didn't do anything. :(I wonder what this setting does, or if there's a
setting to let you truly enter in any frequency.

Transformers f/s: 22 volt, 2.4 amp in plastic case, with jack for computer type ac cord (120V 60Hz input). About 4" cubed, 3.5 lbs. each, unused mint condition, $3.75 each or 4/$14 plus UPS. 36330 zip.(Alabama) Can be used with a rectifier and appropriate sized cap to power 28 V filaments, or as is for 21 V or 24 V sweep tube filaments. Also good for 24 V power supply. NOTE: Please REPLACE the "nspm19" with "wor" to make "worley" or call 334-347-5281 day/eve/wknd.

Hi Jay

If you haven't seen it yet, there's an application for this chip
on Harry Lythall's page. I've already plugged him once today,
so you'll have to find the URL on your own.

I have a few TDA7000s in the junkbox that I _might_ let go of, but not for
free. I'd also be very interested in locating a reliable source for this
part. Radio Shack used to sell them, but that was about 10 years ago.

I drew a blank on Mouser, Digikey, and NetBuy for TDA7000s....

What a huge need of bytes!

Take a look at

http://www.guernsey.net/~sgibbs/resistor.zip

which expands to RESISTOR.COM for DOS, all
of 982 bytes. Decodes resistors with 3-6
colour bands. Been available for download
from various ham radio BBS for the last 8 years.

(about detector diodes...)

: Farnell list some really interesting HP (285 series?) diodes in their
: Semiconductor Catalog. I can't remember the exact spec but Vf of 0.25V and
: designed specifically for power detector use (up to 5-6 GHz). Priced at about
: 60p each (MOQ 5). They are of course in SMD packaging. I'm tempted to get a
: few myself and see what kind of range they are capable of without biasing (I
: would guess that they can detect down to -20dBm or so with a normal high-Z
: VOM).

I've used some HP HSMS-2850 diodes for (unbiased) detectors in field strength meters. I used an op amp to amplify the detector output to read on a meter. The op amp is a chopper-stabilized Harris part with typically about 1pA input bias current. The circuit performs a logging function, so I can read from MDS to a few volts all on one meter scale. I'm able to "see" RF voltages down to around 50uV, or something like -73dBm, with them. I could probably go lower than that, but at that level I really need more selectivity in the front end to make it useful! (This is for hidden transmitter hunting.) These diodes are meant for use in zero-bias detector service in inexpensive things like RF-ID tags, so in volume they are pretty cheap. Yep, they are SOT-23 package. (Gee, I just noticed that I'm probably running them sometimes above their rated reverse breakdown voltage! ... I should maybe re-think my design so it's tolerant of higher voltages. :-)

If you have a look on the HP web site, you can find ap notes for zero-bias detector diodes. I've read a couple of them and they've been helpful, but there are a lot more there than I've had a look at.

You can purchase the software from Motorola, as we all had to do, or you can take or ship the radio to a Radius or Mororola service center and have them program it for you.

Motorola is on the war path big time for people that sell or give away copies of their software. I have NO intension of pissing them off.

If you would like our shop would be happy to prog your radio for you.

good luck, Dale.

would choose AA119.
I use 2x 1N270 in my VHF/UHF mV meter probes, works ufb on 1152MHz, but
I have only calibrated the meter up to 600MHz.
Believe the advantage with Ge-diodes over hotcarrier is higher PIV, some
very sensitive lowbarrier diodes have only few volts PIV, so the actual
applications seem rather limited.

There was an article back in Ham Radio - November 1987 - about how to build
an RF Voltmeter which is simple and accurate over a fairly large range of input
levels and frequencies.

It's the simplest design I've ever seen whch has this broad of an accurate range.

Get a hold of the Yellow Pages for your area and look up ALL the Radio Shack
stores and then visit them all. When RS discontinues a part very often you can
still find it on the shelves. An added benefit is the longer it is discontinued
the cheaper it becomes! For example, I've picked up ceramic(really-not
plastic)"dogbone" insulators for about 27 cents! You just gotta look...

There is far more to building a repeater than just "wiring two radios
together".

Additionally, if you have no idea what something a simple as a COR
(carrier operated relay) is then you really do need to hit the books
before starting such a project.

4013. BIG list of HAM TUBES F.S.(updated 10/29/98)

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-29 00:00:00 UTC
From: tubecntral@aol.com
Message-ID: <19981029084122.23335.00001003@ng-fd2.aol.com>
Source record: 77561

Hello, I have the following Amateur radio tubes for sale. All are NOS
in the original box unless stated otherwise. When possible, (some tubes
can only be tested in curcuit) tubes are tested with a Hickok TV-7D/U.
I have a vast amount of tested, miniature tubes for your recievers,
transmitters, test equipment, etc. at very reasonable prices. Also have
a pretty huge stock of all types of NOS tubes, please inquire about things
not appearing on any of my posts. I'm in the midst of learning how to
set up a website, perhaps in this life :o)... Shipping extra, runs only
3.00 and up, whatever the post office charges...insurance is only a buck
or so, depending on the market value for the particular item(s).
The large transmitter tubes have been checked via ohmmeter.
I will only shipped these fully insured.
Of course, i'll guarantee them to work properly, so PLEASE TEST CAREFULLY
IMMEDIATELY apon arrival, and if it doesn't do what you like, just send it
back right away for a prompt refund,(in original,shipped condition) less return

shipping charges. If defective, I'll absorb initial shipping costs.
Thanks,
if interested, drop me a line... 73's
Joe Pratt, Tubecntral@aol.com

You may just be able to purchase a new one. Check the following
web site. There are a lot of links to suppliers of Heath parts.

KB9JJA Heathkit Ham Radio Page

http://members.accessus.net/~dwentz/kb9jja/heathkit

also take a look at.

Antique Electronic Supply Online!

http://www.tubesandmore.com

They have a section on transformers.

Dear All,
I am having a go at designing some RF filters for the outputs of a VFo and a mixer. I'm happy designing things from tables but I am interested in being able to caluculate the standard tables themselves. What I want to do is:

1) Just understand how for a filter of a given number of terms how to calculate the standard terms.

2) Once "real" component values are inserted what adjustments do I have to make to the other values to get a similar result and what the filter looks like once the non ideal values are inserted.

A tall order I know - vounteers one step forward.

Thanks in advance

Robin

: Believe the advantage with Ge-diodes over hotcarrier is higher PIV, some
: very sensitive lowbarrier diodes have only few volts PIV, so the actual
: applications seem rather limited.

Of course, that all depends on what you are doing...if you aren't dealing with signals greater than +10dBm, then you don't need much reverse capability in the detector.

But yes, the HSMS-2850 I mentioned in a previous posting has a rated PIV of... 2 volts. I think that's the lowest PIV rating I've seen.

On the other hand, I've seen Schottky diodes with 10s of volts PIV rating, too, though not quite so sensitive as a low level zero bias detector.

http://www.drcomponents.com/

They show literally tens of thousands available in a variety of
disti warehouses they can access.

Trouble is, they don't want to sell to hobbyists.

If all of us want to buy a combined total of more than 100 pieces,
I can probably work a deal with them. Probably run a couple bucks each,
plus shipping from CONUS.
Interest? email to jstrohm@texas.net

FWIW, you can get a couple caps of this value out of old PC power supplies.

Around here, I can buy used/dead supplies for 25 cents each, all day long.
And when I'm finished, sell the fan for a dollar and spend the profit on
sodas.

Must be a very slow process building something when you have to
enter all the resistor values into a computer to determine what
the color code is.

Yep, this is another excellent example of how a single component can
cost much more to buy than an entire working or non-working assembly
which may contain one or more of the desired items. I find this to be
true very often, yet many do not seem to think of acquiring components
in this way. I once bought a marine antenna tuner in a weather
sealed cast aluminum enclosure at the swap meet for $15. It contains
six good sized roller inductors, SWR bridge, many relays and about two
dozen high voltage RF type fixed capacitors in addition to a couple of
air variables, plus a nice box. This is what makes "surplusing" and
scrounging so much fun!

Hello,

I'll go a bit further and suggest you try to locate some of the older ARRL FM and repeaters handbooks, I know no current publications that are as comprehensive. Building a repeater out two transceivers isn't necessarily plug and play. One second thought for the technically minded amateurs it is, but even they will experiance a few gremlins to trap. Good Luck

Color code exam?? you got to be kidding, that would hint that amateur radio is a technically relate undertaking. I a person don't use the color code one aregular basis it slips away. I like the wheel cards, but suppose giving a computer may always be running I can see where a program would be usefull, it's bigger and harder to misplace. I don't remember if the VE3ERP halmcalc collection has a resistor color code program, but it would be a place to start looking

Robin OM,

The information you are looking for requires either that you have some
basic understanding of circuit analysis (which will enable you to write
the
transfer function equations themselves, in terms of the component
values),
or use of circuit modeling software, such as ARRL's Radio Designer.
While the
latter is no substitute for understanding circuit theory, it will allow
you to tweak component values without physically building the circuit,
and
see immediately the result it has on your filter performance, which is
probably all you are really interested in. Or, a few trials on real
filters
will give you insight into the effects of changes in values, and with a
bit
of experience, you will have answered your questions. With no
experience, and

no knowledge of circuit theory, you are in the dark and completely reliant
on schematics and values printed on paper, which can be (and often are) wrong.
Combine knowledge of circuit theory with computer simulation, and then you have a powerful and very useful combination, the basis of design engineering today in electronics.

73 and GL,
Don, W6JL

Ah hell...they're just getting lazy, or don't know how to do anything
that doesn't have a keyboard. My wife can read the color codes, and
she really doesn't know what a resistor is! (That's fortunate when I
spill a drawer of resisters, ain't it??!)

And it wasn't so easy on those dad-blasted six dot mica capacitors. Most "kids" today don't even know "body-end-dot" anymore.

I just recently took the ham exams after an absence from the hobby for 40 years. I couldn't believe there was only ONE question on Ohms law, but FIVE on such arcane subjects as repeater protocol and RF exposure.

James, I have built both the 2M and the 70CM units. They both work OK. I has some excess spectral noise on the 2M unit, but got help from Ramsey to cut it back (cut some power too).

Remember there is no sub audio tones with these units. Many repeaters in my area require tones.

If I were going to do it again now I would go with the TenTec units.

==========

In the UK the TDA 7000 FM rx IC is available from Maplin for GBP 2.27
ea (excluding purchase tax which only applies for UK consumption).
This is equiv. to approx US $ 3.60 ea

Maplin's web site : www.maplin.co.uk

Some years ago there was a design for a 2m rx with this IC in RADCOM
published by RSGB.

>> >> colour bands. 73, Steve GU3MBS
>> >

Many years ago I was given a cigar box full of maybe 2,000-3,000 resistors (alas, no Flor del Caribe's). As I was early in my ham building career, I sat there with the ARRL Handbook color code chart trying to find 2200 or 47K or 1.5 meg resistors. After digging around in that box for a few weeks, I got so where I could instantly read any resistor value on sight.

It stuck with me; I can still do it, even with the 1% values like 236 ohms.

4053. Re: Transistor Amplifier Design

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-30 00:00:00 UTC
From: Roy Lewallen <w7el@teleport.com>
Message-ID: <363950D3.1D08282A@teleport.com>
Source record: 77504

There are not only a lot of different kinds of transistor, but also a lot of different kinds of amplifier -- audio (low-level, low-noise, power types and others), RF (likewise), DC, microwave, and so forth. The design of each kind of amplifier is different and some are extremely different. For example, an audio power amplifier bears almost no resemblance to a low-noise microwave amplifier. (The transistors used in each wouldn't work at all in the other, either.) If you're interested in HF through VHF amplifiers, the Motorola RF Device Data book is a good reference. Other good references for a variety of amplifier types are the ARRL Handbook, and Solid State Design for the Radio Amateur. The latter is available from the ARRL.

Rated at 450VDC? Tell me more. I must admit I've thrown out my share of supplies and never taken off a cover as in a work environment it's not worth saving $25 or $35 with the amount of time it takes to repair a P.S.

It never dawned on me that they might have a decent electrolytic with that a high voltage rating. Where is it used in the supply? Part of some switching circuitry where there are high voltage spikes?

4070. Help: Simple RF project.

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-30 00:00:00 UTC
From: Mark Corner <mcorner@umich.edu>
Message-ID: <Pine.BSF.4.01.9810300953000.3589-100000@weir.eecs.umich.edu>
Source record: 77521

I need some help finding parts/plans/information for the following project. Although I have a masters degree in EE and I am working on my PhD, I plead ignorance when it comes to actually building stuff! All they teach you is transforms and probability. Please don't spare any technical details though.

Requirements:

I want to feed a pulse (TTL level or something similar) into a transmitter that sends the pulse to a receiver that gets it and turns it back into a similar pulse. (The pulse is a 25ms long square that turns on once per second) Not too hard right? Ok, some other constraints. The transmitter can be of whatever size (although no big huge antennas, but the receivers should be able to fit on a laptop. Say 1 order of magnitude smaller than the laptop. Power for the receiver must be run off the laptop or a battery. The signal only has to be received in a moderate to large sized building including walls, floors etc. Transmitter and receiver are both in the same building. The goal is to output the pulse at the receiver as close in time to the pulse that was input to the receiver. (Within a few microseconds is sufficient)

Budget: A few hundred dollars at most for the transmitter (I think it will probably be less), No more than $300/receiver (I am quite sure this will be less) So there is quite a bit of leway in the price, although cheaper is better.

So pertinent questions are:

What frequency band should I be using? Obviously this will be an unlicensed broadcast. AM band? FM band?, 900 MHz? the availability of premade transmittters should be a driving factor here. I obviously don't need a lot of bandwidth, but the more I use, the more definition I get on my pulse etc leading to better accuracy, etc.

Should I use the pulse directly, or should I modulate some sort of unique digital code sequence? Different types of modulation? Advantages/disadvantages?

What power level do I need for inside the building? How does this relate to our friends at the FCC?

What are some good sources of equipment for this? I am sure there are many! Point me to something comprehensive. Any suggestions on parts and tx/rx components? The less construction I do, the better. The point of the project is not this part, but what I am doing with it.

Thanks for any help or pointers to documents that you can give me.

I think you will find that the caps in pc supplies more likely to be around 200vdc and may range from 400 to 1000 uf. The pc supply uses the AC line voltage rectified and filtered. These caps are those. That DC voltage is then switched at a much higher frequency to generate the other dc supply voltages. --

I'm ok with the transfer functions. Or rather I understand the first
principles, not so much the reality.

If you asked me to work out the transfer function of a particular filter
then ok, I can do it. What I don't understand is how you use that for,
for instance, producing the standard normalised tables.

I guess the step is a fairly simple one but I am stuck on taking a
specific and making it general.

>or use of circuit modeling software, such as ARRL's Radio Designer.
>While the

Wot's this. I have never heard of this package. Is it any good and
where does one find it?.

>latter is no substitute for understanding circuit theory, it will allow
>you to tweak component values without physically building the circuit,
>and
>see immediately the result it has on your filter performance, which is
>probably all you are really interested in. Or, a few trials on real
>filters

What I am after doing is taking the results of a set of calculations, or
rather extractions from tables and then overlaying real component values
to see what the non-ideal results are before I build the thing.

Interesting little project you have there.

There are many ways you could do this. One way is to just key an oscillator on and off for the transmitter, but this is not recommended because the receiver would be open for interference when the transmitter is not transmitting.

Another way would be to shift the frequency of the oscillator with your pulse. Still another would be to key a tone off and on, and use that to frequency modulate the oscillator.

U of M has a pretty good EE department and a Ham Radio Club. I'm suprised that you can't find someone around there that can help.

By the way: Go Bucks! Beat Michigan!

Close, but no cigar from Monica. If you'll look inside a 110/220 switchable input supply, you'll find the higher voltage caps. It makes for some very interesting results to hit a 200 VDC cap with the FW rectified output from a 240V main.

Granted, there are some cheap 110V-only supplies. Should you get some of these, you'll merely have to mine more caps out to build your stack. After all, we ARE building out of junk here. Which is, in my mind, preferable to a cigar. You know where the junk's been.

Anybody know a simple way to test for permeability, material, etc. of the toroids you can dig out of these supplies? I'd like to be able to use them for RF. (I'm thinking RF power combiners here.)

I'd also like to hear from anybody who's found an effective way to strap around the control circuitry in a PC supply to make a single-voltage supply whose output can be controlled by changing the winding ratio on the output transformer.

Wouldn't it be GREAT to buy a 300 watt single-voltage DC supply at any voltage you like, for 25 cents?

Hello Dave,

Might these be 2SC2810 transistors?

If so, Mouser Electronics (USA!) has them at $1.45 each. They show them in an MT25 package and describe them as an NPN power switch.

Good luck,

Bill

Hello All,
I was doing a bit of reading about Capacitors getting ready for my big weekender project.
I was really trying to understand why sometimes "NPO" is called for in RF designes and other times just disc, Like "All Fixed Caps are Ceramic NPO type".
I understand this has to do with the Temp Coeff., but I still really don't understand why I need NPO.

So can someone explain NPO vs of types of Ceramic Disc Caps, and also, is it okay for me to use NPO even if NPO is not called for?

Thanks for any help and 73

I'm sure Linear Tech have an app note for the device you mention. From what I remember their app note for the 1074 was particularly thorough.

Jim:

You are correct in assuming that NPO has something to do with
temperature performance. Use of an NPO dielectric in a capacitor yeilds
a negative temperature coefficient to the capacitor. This is just the
opposite effect that most other 'normal' dielectrics yeild to a
capacitor. I have been told that the X7R designation for the dielectric
is the same as NPO. The reason for the NPO requirement is not so much
for the negative temperature coefficient but more for the performance of
the capacitor at RF frequencies. Not all capacitors are equal at RF and
microwave frequencies. Yes, you can use the neg. temp. coef. to design
a temperature-stable VFO, but that's another application. For instance,
there used to be a 'standard' bypass capacitor (CK05) used everywhere in
digital circuitry to keep RF out of the designs. A 0.1 uf value was
common. However, the capacitor went seried resonate at about 1.5 MHz -
hardly high frequency by today's standards. Beyond this frequency, it
became INDUCTIVE. In addition, it was anything but stable with
temperature. Its 'desirable' performance waw due mostly to the choice
of the dielectric. It made a LOUSY RF bypass. The advantage of the
dielectric used was that you could pack a 'lot of capacitance' into a
small volume. However, its performance at RF frequencies was not
desirable. The NPO dielectric does not have as high a dielectric
constant as many of the (newer) more exotic dielectrics, but it behaves
well at RF frequencies. The NPO dielectric can also take a reasonable
amount of RF current while the newer 'designer' dielectrics may perform

well at low power levels at RF frequencies, but can not handle much current. Again, the old 'tried-and-true' NPO dielectric excells here as well. A good compromise is the (again, old tried-and-true) mica capacitor. In this case, the dielectric is simply the silicate, mica - the mineral you can peel off in ever thinner sheets. It has a reasonable dielectric constant, good voltage breakdown characteristics, can take a reasonable amount of RF current, and is relatively stable with temperature. If you can't possibly find an NPO dielectric capacitor where specified, a mica cap. is a good second choice. By the way, the BEST all around dielectric for RF and microwave frequencies is good old ceramic much like the enamal on your stove top. These have been used for years at microwave frequencies long before the rest of the world 'discovered' surface mount components. Bottom line: at RF frequencies, use either NPO or mica dielectrics.

Hope this helps. If not, please email and I'll try to answer further questions.

You might want to double-check this. My recollection is that
capacitors with a COG designation are equivalent to NPO. If
my memory is correct, X7R capacitors exhibit a temperature
coefficient and also a nonlinearity that makes them less-suitable
than NPO capacitors for some applications.

If you want something already assembled, try linx-technologies. They have 400/900Mhz transmitters/receivers in a little module DIP package. You add the antenna and encoders. I beleive they have TTL inputs/outputs and work up to 9600 baud, which should get you a decent rise/fall time for the pulse.

There are a few other companies that have these too. All of them range from $10-$40 each, so the price is right. The frequency is high enough that you can use a nice small antenna and still get good range. 900Mhz would be great to xmit through the walls.

Hope this helps

Recently I ordered some NPO caps from Tech-America. They sent the wrong
lead spacing so I returned them. To get a credit I had to talk to a
tech-rep(???) and explain the problem. During the conversation I asked
if he knew what NPO caps were and he replied " Sure they are
non-polarized capacitors". So much for their tech help.

I believe you are correct, Don. The designation is NP"zero", not
NP"OH".

Many capacitors have a negative temperature coefficient, like N750.

P's are unusual.

If the supply has a 120/240 switch, you will usually find two 200V caps
in series. When the switch is set to 120 the input is configured as a
voltage doubler, at 240 it is a full wave bridge. In both cases you get
around 300VDC on the cap bank.

4098. Re: Hamtronics

Newsgroup: rec.radio.amateur.homebrew

From: HP Authorized Customer <joe@user.com>
Message-ID: <71cir0$pp4$1@fnord.systemsoft.com>
Source record: 77549

Years ago a group of us in Texas built a complete repeater
using Hamtronics stuff. Not bad, but then, not cutting edge
either. Overall it was pretty neat stuff, but we were close
enough to Ft Worth to get the subscription TV stuff at 2.3Ghz
with a coffee can so you can imagine what the environment
was for RF. In addition, we didn't have a duplexor, we put
two Ringo Ranger's on a tower and played with the verticle
spacing to get minimum interference, and tried to play with
their helical preamp and stub traps and other stuff. It worked,
but we never were able to go much above 3 watts or we had
serious problems. Then one of the guys picked up a Midland
220 unit, and we 'split' it and wired it as a repeater. We still
used the Hamtronics pieces other than the receiver and transmitter
and things were MUCH improved.

I also built their 2M SSB Transverter. When they say kit, they
aren't kidding. Blank etched and drilled PCBs, no silkscreen,
no labeling. But it was pretty cheap.

I don't know how they are now, but If you expect Hamtronics
kits to be like the old Heathkit, or like the Ramsey kits (Which
are TRUELY EXCELLENT for learning) you will be very
disappointed. But if you want a kit to build where it is nothing
but a blank PCB like you would see in the ARRL handbook, a
bag of parts, and instructions (the instructions aren't bad, but
they aren't like the Ramsey books, which are tutorials on theory)
then you will be very pleased with the Hamtronics stuff.

Could improve the process by putting the resistor in your
scanner, and the program works out what is there.

Now that would be a smart update to an old and
perfectly adequate program.

: So can someone explain NPO vs of types of Ceramic Disc Caps, and also, is it
: okay for me to use NPO even if NPO is not called for?

It's generally OK to use NPO where it's not specifically required, but it's typically more expensive, and you're unlikely to find 0.1uF or even reasonably priced 0.01uF NPO's. NPO (nominally same as C0G designation) is temperature stable, usually within about +/-30ppm/degreeC. "Reference Data for Engineers" in the Components or Parts chapter, talks about ceramic caps in three classes. Class I, which includes NPO, has controlled temp coefficients from +150 to -4700 ppm/C, with tolerances as good as +/-15ppm/C. Class II are MUCH less temperature stable, but the dielectric constant of the dielectric is much higher, so the caps are small, and they are less expensive for larger (bypass-type) capacitances. X7R is typical of this class. Also mentioned is Class III, which use dielectric which has a very high dielectric constant, but it also has quite a bit of DC leakage. I use 0.1uF X7R's all the time for effective bypassing through AT LEAST the HF frequencies in designs I put into production. These are leadless surface-mount chips. The key to good bypassing is not so much in the dielectric, but in keeping the leads very short and the ground paths big (wide) and short. These SMT parts are 0.08" long, or shorter.

You really want to use NPO in circuits like tuned tank circuits or filter circuits you want to be stable. If you built an LC oscillator with an X7R in the tuned circuit, it would drift badly with temperature changes. NPO keeps things relatively stable, though not perfect: but if the coil were perfectly temp stable and you used a cap with 30ppm/C temp coefficient, your oscillator would drift about 15ppm/C, or at 4MH, about 60Hz per degree C. That would be at least ten times better than you could reasonably hope for from an X7R; and it will be much more stable over time as well. You could reasonably substitute silvered-mica or possibly polystyrene capacitors for NPOs. Mica has a slight positive temperature coefficient, and polystyrene has a little higher negative temperature coefficient.

Once upon a time I wanted to build a ham radio station but didn't want to be bothered about such things as resonance... just wanted a simple radio station.

We can see from you comment about the COR that you have a lot of homework to do. The reference to the older ARRL repeater and FM books is a good starting place. Wiring a couple of radios together is the easy part. Making it live as a repeater.... thats where all that complicated stuff comes into play. Best of luck to you. When you need further help come right back here with more questions.

Hi Walt,
If you don't have any luck, try these guys.

http://www.tubesandmore.com/

Part # C-V365-X3Description
Three section, 365 pf. 3-1/4" long frame, 1/4" x 1" shaft.
This item is not currently available, should be in stock by November, 1997.

TRIPLE SECTION VARIABLE CAPACITOR
Price
$18.50 per EA
Mike

Make sure whatever software you're using can use ports using non-standard addresses and IRQs.

4126. identifying inductors?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-31 00:00:00 UTC
From: leeleduc@pacbell.net
Message-ID: <363b88e7.6324132@news.pacbell.net>
Source record: 77479

Is there a "foolproof" way to visually tell the difference between a resistor and a molded inductor? Both have similar color codes and a fab house I'm using is confusing the two causing a lot of rework to be done. I'd like to provide them a reliable means of identifying the parts.

Thanks

4127. TENTEC INFO WANTED

Newsgroup: rec.radio.amateur.homebrew

Source record: 77480

I am thinking of buying the Tentec 10m to 2m transverter. The only reservation that I have about it is its 106Mhz LO. With this freq I can only cover the lower 2Mhz of the band. If it were 108Mhz I can cover the whole band. Can this be easily done on this transverter and does Tentec offer any help with this problem.

Political Correctness is for those who are intellectually
challenged such that they are incapable of working
things out for themselves; or for those who do not
have the strength of character to express their own
opinions (Not including you, George, for I have no evidence
about you that would put you in, or exclude
you from, either of these categories.)

There is a new type from Levtron that are supposedly much more immune to
noise. What they really need is some way to single back to the
controller that that have received the message. As it is, it's just sent
a command and hope it gets there.

4134. A fascinating RF/microwave site

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-31 00:00:00 UTC
From: John Miles <jmiles@pop.removethistomailme.net>
Message-ID: <363BF1C0.B72@pop.removethistomailme.net>
Source record: 77487

An unsolicited testimonial: anyone interested in "bleeding edge"
UHF/microwave homebrewing should check out the following site, which is
owned by Darrell Emerson, AA7FV, of the National Radio Astronomy
Observatory. Don't go there unless you want to lose five or six hours
of your life wandering through some truly nifty links, the way I just
did. I ran across Darrell's site by accident, and might as well have
fallen into a black hole, so to speak.

http://www.tuc.nrao.edu/~demerson

Besides the Millimeter Array (MMA) research links (superhets with tuned
lasers for LOs, anyone?), one of the things on his site that I found
especially mind-boggling was Darrell's historical account of the work of
an obscure nineteenth-century physics professor named J.C. Bose. This
Bose fellow amused himself by building spark-gap transmitters in the
1890s... for the 60 GHz band! In the process he invented a vast portion
of the devices and technologies that the microwave business relies upon
to this day -- things that wouldn't come to the attention of the rest of
the world for another half-century.

Darrell's site is not "sexy" at all, and much of it won't make any sense
at first, as it's not really intended for public consumption but rather
for the engineers and scientists working on the NRAO's millimeter-wave
telescope project. But it is well worth the time required to dig
beneath the surface.

4135. Re: Suitable diode for UHF RF probe??

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-10-31 00:00:00 UTC
From: Peter Bolch <nc-bolchpe@netcologne.de>
Message-ID: <71h5ef$l7@news.netcologne.de>
Source record: 77488

Hi Graham,

I use the cheap BAT62-03W diodes made by SIEMENS. They are low barrier silicon schottky types
useful for detectors up to GHz frequencies and come in a SOD-323 package. According to the data sheet at 900 MHz and a Rload of 1 MOhm the DC output voltage is approx. 0.1 mV for a RF voltage of 2 mV. Diode capacitance is 0.35 pF @ Vr = 0V.

The BAT63-099R is a "zero bias" type in a SOT-143 package and also intended for
GHz detectors.

There are also diode arrays with similar data.

Peter

Perhaps I'm disqualififed from
talking about the "good old
days" (I'm less than 60 years
old, never had a QSO with
HPM, and got my license as one
of those newfangled
Conditionals.

My "good old days" started in
the early 60's, just 35 years
ago, but here is what I
remember.

.... hams didn't bicker with
each other about who was more
"deserving" than another.
Nobody got a special deal
because
they could beep faster or
remember more electrical
formulae
than someone else. I got my
Extra in 1963, well before
disincentive licensing, and it
was simply just another
personal
accomplishment, and did not
"elevate" me above other hams.
We
all shared the same spectrum,
worked together to solve the
same
problems, competed in
contests, trouble-shot each
others radios,
and generally had fun
together. If you forgot the
numbers for
the dipole formula, it was OK
to ask someone else. If your
Morse speed was 10WPM the
speedier guys would slow down
for you,

not QSY to some specially
reserved band segment. The
one or two
"old timers" on 75 meters who
didn't like newcomers ("No
lids, no
kids, not space cadets") were
universally looked down on as
poor
examples of what a ham ought
to act like. The Novice bands
were
a "cacaphony of exhuberance"
to steal a term that K1ZZ used
in
a meeting yesterday here in
Minneapolis. Old hands were on
those
Novice bands also -- it was
not unusual to hear W4KFC or
W5ZD
patiently working WN4KKN or
WV2CNL -- nobody remarked that
it
was "nice" of them to do
that -- it was just part of
being a
good ham. The notion that you
had "earned" your license
never
occured to anyone -- we were
just excitedly "playing in the
ether", and there was no
distinction on the air between
Extra,
Advanced, General, or
Conditional -- elitist special
callsign
formats to celebrate the fine
granulations of your testing
skills
had not been invented.

Today we are sliced and diced
into 6 different classes,
carefully
divided into our own special
frequency segments, and Lord
protect
the Extra who suggests that a

new Technician, who didn't
pass his
exam in front of a bored and
stern FCC clerk, might have
something
to contribute to our beloved
Amateur Radio service.

I respectfully propose that
all current six license
classes be
scrapped and replaced by two
new classes "Beginner", and
"Helper
of Beginners".

I use the STB 4COM card with reasonable success.
This was an under $100 card that provides four serial ports.
You can use the standard I/O and IRQ with these, or select
four new settings (from a limited group). If you are careful,
you can use your standard two from the PC and four from
here for six serial ports. It can also do LPT, but I never fooled
with that. Never had a need for more than one LPT. I would
use a switch if I did.

I dug up a few more of these; hopefully someone can find a use for them.
Dimensions are 4" x 1" x 1.5" with removable sides. Tin plated steel for
solderability. Hole pattern for BNC panel mount connector, w/ 4-40 holes
drilled and tapped.
Originally designed to house a step attenuator, these can be adapted to
serve as the basis for a variety of coaxial RF projects, such as custom
filters,
pre-amps, transformers, etc. We have a fairly large quantity which we are
offering for $1.00 (US) each, +S+H. Please e-mail us at
rodger.e@worldnet.att.net

Blew out one of the caps today. Let it sit to long with running I guess
(about 4 years)
The caps are 100 uf @ 500V (these are the old paper style
electrolytics). The closest I can find is 100 uf @ 450V (500V surge)
aluminum electrolytics. Will these work ok ?
Figured I would replace them all at once. If one goes out I am guessing
the others are
begging me to load them up also so they can go.

Johnny

The MC4514 is probably the Motorola version of the standard 4514 CMOS
4 to 16 line decoder. You should be able to find one quite easily. 4514's
are
about 1 USD, here in Europe.

I can give you the address of a supplier, but I'm sure you can find one,
closer to home.

Look for 4514 or 4514B.

Rose colored glasses? I remember a net called Westcars (West coast amateur radio service) that operated in CA in the early 60's. It was on the same 40 meter freq day in day out and arranged mobile and phone patch traffic. The malicious interference and bickering that went on rivals what you hear today.

Hi

I am looking for a schematic of a TRAC MESSAGE MEMORY KEYER.
Picked the little gem up at a flea market and naturally it doesn't
work.
While trouble shooting, I have found that half the chips were
installed
backwards. Now I am not sure that they are even where they belong.
Anybody out there might have a schematic that they could scan and send

or photocopy. I would be very willing to pay for copy and postage
costs.

Regards
Reed

At my QTH I suffer from infrequent short bursts (approx. 1 second) of noise right through the FM broadcast band and including 2m. I have been thinking for a while about starting a real time direction finding project to help me locate this source of interference. I envisage something like a compass dial made with LEDs that latches the direction of received signals above some threshold.
I'm looking for ideas on how best to do this. Does anyone know of any extant designs?

4163. Zero dbm. = 1 milliwatt. TO TEST CRYSTALS.

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-01 00:00:00 UTC
From: Terry Sanford <tsanford@roadrunner.nf.net>
Message-ID: <363BFA05.75DE@roadrunner.nf.net>
Source record: 77498

Zero dbm. = 1 milliwatt. This shouldn't cause any problems to a crystal.
(dbm means "in reference to one milliwatt").

However if you are concerned you could isolate the crystal with say a
10db loss pad this will reduce the power applied to the crystal to less
than one-eighth of a milliwatt. Or, reduce the output of the test
oscillator/generator. Watch your impedances1

Note: every 3 db.reductiom = half the power.

Regards. Terry S. Torbay, Newfoundland, Canada.

4164. Wanted schematic on MRF492 Six meter amp

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-01 00:00:00 UTC
From: talbot@krems.kmr.LL.mit.edu
Message-ID: <71h4ctfcq1@nnrp1.dejanews.com>
Source record: 77499

Fellow Homebrewers,

I am looking for information on a Six meter amp using a single MRF492 RF transistor and an LM358 IC in the control/switching. The Circuit board was made by "SIX-TWO-FOUR" and the Case says 624 Systems Solid State Linear Amplifier but it is homebrew (or from a 'garage company').

I have done a Dogpile, Electric Library, Dejanews and ARRL Web search and have not been able to find the schematic. I did find one reference from Far Circuits that took me to the ARRL web (it mentioned October 1990 QST) but was unable to find the information at the ARRL.

I am repairing this 10 in 80 Watt out amp for use on the V73SIX beacon.

A schematic or URL to locate the information would be appreciated.

73,

George V73GT

4166. CB to 10 conversion

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-02 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <363d366a.27052320@news.erols.com>
Source record: 77372

I bought an old Lafayette Telsat 25A SSB-AM CB transceiver at the Gaithersburgh 'fest. It works! Now I need to convert it to 10.

I don't have a schematic, but just looking at the circuit board, I think I have figured out most of the frequency scheme:

First mixer uses crytals in the 7 Mhz range working on third overtone to beat the RF down to 3.6 Mhz. Second mixer uses 14.9 Mhz rocks to shift to 11.2735 Mhz, the freq of the crystal filter. Looks like there is a product detector at that freq - I see USB and LSB rocks nearby.

I'm a bit puzzled by a crystal at 11.730 I see nearby. Could it be that they use that to beat the IF down to 455 Mhz for AM detection?

Anyone familiar with these old pre PLL rigs? any idea on the easiest way to do the conversion.

I think I've already got my 5 bucks worth?

Knowing how the FCC works, your statement is kind of humorous.

The FCC endorses the ARRL proposals. The ARRL showed them
that incentive licensing was the way to go, and the FCC rubber stamped
it. The same with the Spread Spectrum rules. The ARRL wrote them,
the FCC rubber stamped them, it is now law.

The ARRL is writing new rules for 5 wpm General (seeing how they are
dying off faster than people are upgrading) and the FCC will rubber stamp
that as well. The ARS is not that important a service for the FCC to
staff and spend real money on.

If Joe Blow petitions the FCC, his proposal is stamped "premature." If the
ARRL send in the same proposal, it is made the law. It's not that the ARRL
is any better/smarter than Joe Blow, it's just a way of doing business
cheaply.

To say otherwise is just ignoring the facts.

Bill,

One of the FEW decent contributions ever made to Amateur Radio by Wayne Green's rag was that during the LAST cycle, "73" ran a bunch of conversin items on CB to 10.

You might inquire of "73 Publishing" if they have a bibliography of conversion articles and proceed from there. The LaFayette line was a very popular project.

Also, CBC Inc (advertizes in Popular Comm and CQ a lot) has numerous CB to 10 conversions (as I am sure they have 10 to CB conversions, too! =))

By the way, I went to a rally in Hadsten/Denmark this week-end and bought a 12GHz SATTV signal meter*) for ¤18.-, somebody mentioned the normal price in shops is ¤35.-
It detects down to -70dBm. It is connected on cable between LNB and tuner, and it has supply voltage from the tuner.
It also has a gain control.
Dont't expect it to be very accurate, but suppose it would work on lower frequencies as well, have to open it, mount SMA connector for i/p, and modify it for 50 ohm.....

*) Promax MS-250 Satellite signal meter

Procom also makes a 90dB range microwattmeter with -70dBm sensitivity, it is quite a different price range, but I don't fint 90dB range on an analogue meter to be too useful.

4178. Multiple Sound Cards in PC?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-02 00:00:00 UTC
From: jbolinger@lintek.com
Message-ID: <363dec5d.0@news.netwalk.com>
Source record: 77384

Anyone know if it is possible to put multiple sound cards (soundblaster 16, for example) in a PC and synchronize the sampling between the two cards?

I can think of all kinds of neat things that could be done with 4 channels of 'high speed' a/d conversion, particularly if the sampling of the 4 channels could be done at the same time.

As far as that goes, do the two channels on a single sound card sample at the same time?

>problem.

Are you sure about the 106 MHz?

According to my calculator you would need a 116 MHz LO to convert 144 MHz to 28 MHz. And this would translate 28-30 MHz to 144 to 146 MHz.

The whole purpose of such transverters is to allow CW and SSB operation on 2 meters. All of this activity is in the first 500 KHz or so of 2 Meters, so I see little need to extend the frequency coverage.

You weren't listening, Steve, so I'll say it again:

Just a reminder - in 1959, the FCC published a Notice of Inquiry asking what incentives could be tacked on to the Extra Class license. They received thousands of comments. We periodically read of folks criticizing the ARRL for "...hurting amateur radio with their incentive scheme..." but it was really the FCC itself that planted the idea in the first place.

I was in contact with TENTEC this morning and according to there rep the information on changing the LO freq is included in the kit, unforunately they do not sell the crystal. The guy I talked to said that they reccomend JAN as a source for the crystal. I have not dealt with JAN in a long time but I remember telling them the freq and what it went in and that was all the info they needed.

The more recent PCs have 1 or 2 USB (Universal Serial Bus) ports .
Each port can be daisy chained to 127 devices , which now start to
appear on the market ie HP scanners and printers.

I also have a Wahl bought in 1981 . Earlier this year the Nicad
batteries remained flat . I removed them , there was some muck across
the connections ; I cleaned them ; now they are 100% again ,really amazing !

However I would advise anybody wishing to purchase a cordless
soldering iron to consider a butane gas device
; refill is from a Ronson can used to refil cigarette lighters.

The make I use is Portasol -from Ireland (Eire) . Each soldering tip
has its own catalytic burner . There are various sizes of tip ;there
is even a hot air blowing element excellent for heat shrinking . The
amount of gas can be adjusted from very little to full flow the
latter resulting in about 60 Watts equivalent output. Very good for
outdoor use as well .

The gas powered soldering iron is my favourite .

: resistance
: at the grid.
: Pete
: ...

Your answers are pretty vague. As stated, the impedance of 4CX250's and most tubes in grid driven operation is very high. High Mu operation requires careful construction practices and neutralizing in a lot of designs. The technique of "swamping a grid driven circuit helps to stablize things.

Cathode driven circuits have much lower impedance values, often well below a few hundred ohms.

The choice between the two types of operation is often made from the avail driving power. In grid driven AB1 no power is consumed.

Has the ham fraternity been consulted on the implications of this form of wire free communication for PCs and peripherals etc. in the low Ghz bands.
The system will lack pronounced carriers but will occupy significant bandwidth and will be capable of demodulation up to 100m in the higher power version.
Two systems operating from the same building will see a background noise increase of 3dB compared to a single system, a building full will raise the background noise quite a bit where noise floor is important.
Seems a bit like the effect street lights has on astronomy.
Doug Dwyer

I agree. I have both the rechargeable type as well as a Weller PSI-100 butane unit. The Weller is hands down a better unit in terms of heating as well as usefulness in the field when away from a recharging source. If you need to solder PL-259's, heavy power cables, etc. the butane unit is the way to go.

Hi Jim!

With most of the lower end sound cards like Sound Blaster, etc, there is no provision (at least an intended provision ;-) for syncronizing them together. If that is a requirement - possibly look at something like an Event Electronics Darla or Gina audio card (2 in - 8 out and still won't sync to another card..) - unfortunately they are not in the same price realm of SB's. A thought though - since the synchronization on each of the SB's is referenced to each boards on-board clocks - maybe disabling the clock on one of the "slave boards" and using the clock off of a "master" SB... after all - tinkering is what we do......

It can be done. I have several that I built that works as well as if not better than the commercial units. BUT, because of the wire wound coils needed to handle the RF power you need a sweep generator to tune the coils. Would be an expensive project for what sells for <$50 US. My time is worth more than that even though I have the equipment.

Just my 2 cents worth.

Steve, Whether with or without the help of ARRL ..... when you
decided to sit the test for the Extra Class ticket , you must have
had an ...incentive and Hurraah you passed and are now eligible
to use all the spectrum allocated to the Amateur Service
.....that must have been the incentive.

BTW among the Amateur Radio organisations on our globe ARRL is one
of the prime promoters also outside the USA , worth to be proud of.
The VE system almost unique in the world , provides licencing
opportunities second to none and at minimal cost ..... another
ARRL achievement .

You might try doing a search on Fox Hunting or Trasmitter hunting. I think the equipment exists. Also I believe APRS supports something like that. Good Luck, art.

A2 is the 500 MHz LO, as you note, but it comes off the A2A4L1 output transformer as a tertiary winding that's otherwise isolated from everything in the assembly (see foldout page 8-21). I would be surprised if there are any negative consequences to leaving this line unterminated from the analyzer's point of view, although in an RF-clean environment you would not want to leave it unterminated as the rear-panel connector could act as a low-level RF source.

It looks like A4 really comes out of the 8552 IF assembly, which is where the 47 MHz LO originates. It is probably ignorable as well.

I couldn't seem to find where A6 ("Tuning stabilizer enable") originates in the A10 assembly, in the manual. If the LO stabilizer works OK, I'd say ignore this one too.

>
> Given the large amount of surplus units around I had assumed

> what the observed performance was in this situation.
>

I played with an 8555A awhile back, but it had a fried input attenuator when I got it, so I couldn't tell you if the missing terminator affected

its operation or not. My guess is that you would be very hard pressed to tell the difference in the operation of the analyzer with or without the terminator; it is probably an EMI/RFI feature more than anything else. You want to avoid even the remotest possibility of spurious signals leaking into the analyzer signal chain, or out of it for that matter, and that's probably what the terminators were for.

IMHO for normal home/hobby use in a reasonably RF-quiet environment, the 500 MHz LO output is unlikely to be a problem. If you're worried about the other lower-frequency ports, you could easily open up the 8555A unit and solder some internal resistors in place, and disconnect the output lines. I wouldn't bother doing any of this unless you suspect a problem. Certainly you're not risking damage to anything.

You could also wrap the outer housing of the output connector in foil, covering the connector ports, for improved isolation.

Hey guys, I remembered I had made a ten meter rig
out of one of the Hy-Gain chassis back in the early 80's
Took a look in the current Fair Radio Sales catalog and
they still offer them! Page 22 of the 98-1 catalog.

Supposedly the ones they have left are "incomplete", but
for $6.50 each, at least you have a PLL base to build on.

References articles in 73 magazine of 2/84 and 2/85,
10 and six meter mods for the boards. I did the 10 meter
version, and it worked great, I just got rid of it and went on
to other projects over the years.

Anyone interested might give them an email -
fairadio@alpha.wcoil.com

"Doorknob" is a style of case which looks (surprise) like a doorknob.
"Feedthrough" is another style of case which is designed to be
panel-mounted and passes a conductor through the panel while
simultaneously bypassing it to the panel. "Transmitting" capacitors
are designed for high voltage and high current carrying capability.

You could have a "transmitting doorknob" cap or a "transmitting
feedthrough", but I've never seen a "feedthrough doorknob". Help any?

I don't know who or what you are, but a historian you are NOT. The FCC--you know, that entity that regulates the electromagnetic spectrum in the USA- first proposed Incentive Licensing in 1959-about the time you were eleven years old. The ARRL entered the scene as it always has--as the advocate for hams, and most of the details of the plan that was adopted came from the FCC, *NOT* the ARRL. In fact, ARRL persuaded FCC to drop succeding phases which would have caused even more pain to some hams. But it gives you a good excuse to inaccurately bash the League, and complain, to say nothing about braying your license class about. If you held a pre-Incentive extra, and that seems unlikely, you had one of some 4,000 then issued. Most were held by commercial CW operators, and there was no real reason for mainstream hams to concern themselves, after all there was NOTHING to be gained except the "prestige". And for most people "bragging rights" are worth what they apppear to be worth--not much.

So stay away from the ARRL-- they'll continue to work for the best interests of all hams anyway, you included--if they can figure out what those interests are, given all the garbage being spread these days.

Anybody out there put one o these on the ham band? I have identified the following to change/retune:

Duplexes(obvious one)
Preamp
Injection filter
Harmonic Filter.
Exciter Filter
RX input helical.
Exciter offset xtal(go from lo rx to hi rx.)

Anybody tune one of these duplexers down from 463/468 to 443/448?

It runs in the 2.4 GHz Industrial. Scientific & medical band
already allocated. Most countries have 100MHz allocated.
Bluetooth is 79MHz wide and uses hopping to spread spectrum.

Power is 0dBm (fixed) and 20dBm (automatic power levelling).

Range: in the 10m (0dBm) to 100m (20 dBm).

I was at the Atlanta meeting but hams were notable in their
abscense. Seems real engineers don't get involved with
amateur activities any more. Something to do with
switching a carrier on and off, slowly, by hand.

>Can anyone tell me the difference between doorknob, feed
>through, and transmitting capacitors?
Doorknob and feedthrough have to do with the physical construction of the capacitor. Doorknob caps are typically cylindrical with a screw connection at each end. Feedthroughs are intended to mount in a hole in a panel, simultneously passing a connection through the panel and providing a bypass capacitance to the panel. Transmitting generally just means the cap is designed for high power/voltage use. Many transmitter designs use doorknob caps.

Thanks to all who posted info on the conversions. I'm really having fun with this thing!

I started to consider conversion options and was thinking about building a little VFO to replace one of the 7.7 Mhz rocks. Lo and behold I notice that the previous owner was way ahead of me. He had used the phono jack for the "Public Address System" output and converted it into a VFO input. A length of coax runs from the jack to where one of the crystals was. I imagine he was trying to move the rig to the "freeband" freqs, correct?

One downside of all this is having to listen to some of the chatter on these freqs. Makes 14.313 sound like Masterpiece Theater!

It depends upon the disability.
Sadly I find my personal disability a great handicap.
Regrettably therefore the statement is not generally valid.

It is a false statement.
It is not accurate either. To be an accurate statement, the opening indefinite article should have been, "A" and not, "a". With an opening, "a", it might be an accurate clause.

Hello radio freaks

Does anyone know how to interconnect the three jack connectors on the top of
the hand held Alinco DJ-580 radio, to do the following three actions:

1) TOGGLE between memory and "direct frequency" mode.
2) Step one memory channel / xx kHz (depending on step size) UP
3) Step one memory channel / xx kHz (depending on step size) DOWN

Is it possible to do any other actions via the mentioned jack connectors?

Yours faithfully
Bjarke Korsgaard

Yes!

This is exactly what my Master's Thesis project did! It was a prototype design for a radio astronomy imaging system. The prototype worked on 162.4 MHz.

What you will need are a minimum of 3 antennas and 3 receivers covering the frequency of interest. More will be better but 3 is the minimum. Simple direct conversion receivers could be used, but superhets would be better. They should be SSB type receivers. All receivers must have a common local oscillator and the receivers must be as linear as possible (FM receivers will not work very well).

The antennas should be arranged in a circle with a diameter of 1/2 wavelength at the design frequency. You will then need an A/D converter at the output of each receiver. All A/D receivers should sample at the same time, or at least have a known and constant time offset from each other.

Collect a burst of data from the A/Ds. There should be a power of two number of samples in each burst from each A/D. The sample rate should be at least 4 times the bandwidth. Run the data through a two dimensional FFT and there you have it! A 'picture' of the radio environment! In fact my thesis project was nicknamed a 'Radio Camera'.

My Thesis title is 'A Simultaneous Multibeam Phase Array Using Digital Processing Techniques'. It is at the Engineering Library at the Ohio State University, Columbus Ohio. I don't know if they will send you a copy, but you can try. (In fact, if you say 'please' enough I might even send you a copy my self---but I have a limited number and am quite protective of them. Contact me by email directly if you are interested.)

Hello George V73GT, Information can be found in
QST 1982 May page 11, under a Solid State 6 Meter
Linear Amplifier You Can Build
Also in the Motorola - RF Device Data Volume 1
page 2-683 & 684 Figure 1, 50 MHz test cir.
I hope this will help any one wanting to build a
Homebrewed 6 meter amp.

Was thinking about this some more.

Actually, a system as I described is probably overkill.

If there are _multiple_ signals from different directions, then the system that I described would be useful. However< if there is only _one_ signal from a single direction then it could be done much simpler with a circuit known as a Dopplescan.

This has been described in the Ham literature but I do not have the references. Perhaps someone else on this news group does. Also, I beleive that there is at least one commercial system available, but someone skilled in construction of VHF circuitry could easily build one.

The basic idea is to have (typically, although more could be used) 4 antennas located on a circle with a diameter of 1/2 wavelength. The antennas are switched in sequence to a single FM receiver, with the switching rate being around 1 KHz. When a signal is being received there will be a phase difference between the audio output of the receiver (which will be 1 KHz) and the 1 KHz antenna switching signal. The phase difference can then be decoded and displayed on LEDs as you first described.

I do not know how well this would work on a wide band noise like signal, however. My first guess is that it may not work all that well as modulation or wide band noise could confuse it. The Dopplescan is mainly intended for DFing narrow band FM/AM signals or unmodulated carriers.

From your description I would guess that the source of the noise is relatively close. Have you considered taking a stroll around the neighborhood with a portable receiver? You may be able to locate the source using this 'crude' method. Are there any factories or shops in the area that may be using

electrical equipment? Any neon signs or mercury vapor lights? Any 'touch' lamps? Any aquariums? (The thermostats in aquarium heaters have been known to cause problems.) Does the problem occur more at certain times of the day? The answers to all of these questions will give you a good start in locating the source of your problem.

4229. Re: qso recorder with Sound Blaster

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-03 00:00:00 UTC
From: HP Authorized Customer <joe@user.com>
Message-ID: <71n9am$70n$1@fnord.systemsoft.com>
Source record: 77434

I wrote one a long time ago. It was DOS based. The program
would load one of the SB drivers, and make calls to it. I know that
the progam was included on the CD-ROM that came with one of
the Queue books on the sound blaster. I think I loaded the CTV-DSK
driver from the SoundBlaster.

I set it up so that 10 of the functions keys were 10 'channels'. Hitting
F1 for example would play the file associated with the F1 key. Hitting
F5 would close the F1 file and immediately change to the F5 file.
I recall I hit CTRL-Fx to record. You could change files and modes
on the fly with no problems. I was going to put in ALT-Fx functions
to change speed, mode, filename, ext, or even assign text to 'label'
a file. I also wanted to add output control, have the 'play' function
toggle a printer control line or an RS-232 line, to be able to key a
rig, but never got around to it. I think I ended up adding SHIFT-Fx
to assign screen labels to each of the files.

It was great to use when you had a difficult QSO, and you could play
back pieces of it again and again. Or to assign contest phrases
to files.

I wrote another program with the same (or similar) routines that used
a PC with a Sound Blaster to be a simplex repeater. I even put in
playing an ID file every so many minutes, as well as keyboard control
and override for forced ID, breaks, and so on. It used a printer
status pin to detect squelch, and a printer control pin to key
transmit.

Both programs were a real bitch to write, as the 'Official' Sound
Blaster books that documented how to use their drivers were
flat out wrong, and would corrupt hard disk if you tried to use them.
The way they documented the routines, you would try to terminate
transfers, but the DMA was still streaming. I spent time with Soft-ICE
tracing that NASTY bug down. Finally got it working, and everything
works on the fly and fairly robust.

The programs were on the ham radio forum of CIS, as well as in
the book. It's been a while ago, and at least 3 PCs for me, but I
should have the source around somewhere......

In fact, I think I have an older source here. The names I used
to distribute the programs were GEN_V for the recorder/player,
and VPRD for the simplex repeater.

There are two new components that makes medreally want to start
building stuff:

Mini Circuits HELA-10
1 Watt amplifier with IP3 +49 dBm IP2 88 dBm 50-1000MHz!
$19.95

Silicon Laboratories SI 4132
Dual band PLL with 600-2000 MHz and 50-600 MHz outputs.
PLEASE note this 24 pin TSSOP IC includes all but 4 passive
components, i.e. VCOs resonators, loop filters, prescalers
Price unknown at present time

Who will be the first to do something fun out of these????

Cheers

4231. Problem with a TV...

Newsgroup: rec.radio.amateur.homebrew

From: Denis <mhzsrc@pratique.fr>
Message-ID: <363F2D70.166842F8@pratique.fr>
Source record: 77436

Hello !

I'm experimenting a problem with a TV (a Philips, 70cm, 100Hz).
When ON, this TV is producing a very heavy interference, covering 9.5 to 30 (more) MHz, preventing me from listening in good conditions.
I removed antenna and SCART cables from the TV: the problem is always here even if only a blue standby screen is displayed (without picture).

I puted a main filter on the main supply without success.
I tested several receivers as well as several antennas, all showing the interference so I'm quite sure now it comes from the TV.
I must add that the TV is at least at 15 meters away from the shortwave beam antenna.

For those involved in TV repair that may help me, the TV reference is 28PT7303/19.

If anyone could help me, I would appreciate.

Sorry for my bad english !

Denis

Where did you put the mains filter? If it was placed where the cord plugs into the wall, the power cord may be radiating RF. I would try coiling up the cord in a small ball, as close to the TV as possible. Then, use an extension cord between the mains filter and the wall socket.

If that doesn't work, I would try to get a "toroid choke core" (Radio Shack part #273-104 in the USA, I don't know if they're available in France) and put it on the power cord as close to the TV as possible. This has been known to cure this problem on MW, and I would think it would work even better at 9.5-30MHz.

I would like to experiment with some of these new chips my self. There are a lot of interesting ones available, but....

...I have trouble even seeing the pins on the tiny things, let alone soldering them.

Does anyone on this news group know how to use these critters without destroying them? Prototype boards from the manufacture are usually unassembled (at least the cheaper ones) so you still have to solder. Keep in mind that I am talking about at-home use, and I can not afford a wave solder machine!

Are there adapter sockets to convert to DIP format? Although that would destroy the frequency response of a 1Ghz chip it would certainly be easier to solder.

>one of the "slave boards" and using the clock off of a "master" SB...
>after all - tinkering is what we do......
>

The idea is to be able to use a stock sound card as typically found in a PC.

If each card runs off a master clock the sampling of the two inputs may be synchronous in the strictest sense, but that still does not say that they are sampled simultaneously. If they are not simultaneous but the time difference is constant then this is still useable. You just have to do a bit of 'mathematical trickery' to compensate.

Professionally I am writing DSP programs for a 'virtual RF instrument'---essentually a signal generator, receiver, A/D converter, and PC (don't think anyone on this news group could afford one, so please don't ask). I have been thinking (actually, even several years before I got this job) that it would be possible to do something like this with a PC for the Ham and home experimenter. How about a 3x4x5 box with two RF connectors, one data connector, an LED read out, and a program on your PC? Inside the box would be a signal source and two direct conversion receivers. This would be connected to your PC serial port and sound card, with the LED readout useful for remote operation (such as at the top of a tower). Then this could be used as an antenna impedance tester, phase meter (for adjusting phased arrays), RF filter tester, network analyzer,.....

For this device only two A/D channels would be needed. Some other ideas that I have require 3 or more channels.

Bonjour cher om
Le probleme de votre 940 est bien connu !!
Lorsque vous avez ce genre de probleme cela veut dire que votre PLL n'est
pas verouille donc il est incapable de se caler en reception et en emission.
Ne vous inquiete pas votre 940 n'est pas mort hi!!!
il suffit simplement de refaire toutes les soudures sur la platine PLL unit
qui se trouve de memoire presque au dessus du hp.Mais vous auriez tant qu'a
faire refaire egalement les autres soudures des platines car malheureusement
cela est son seul defaut

I'm doing something vaguely similar to this. I've been using a pair of SBL-1
mixers, fed a signal in parallel and fed a local oscillator in quadrature. The
outputs of the mixers feed the left and right inputs of the sound card. This
gives me I and Q. From there it is all software. If I put a Hilbert transform
in one channel and then sum the channels, I get SSB, LSB or USB depending
on which channel I insert the Hilbert transform. Or I can envelope detect
(abs function) the I channel and get AM. Etc.

This was all working fine using an Analog Devices EZLite kit
as the digital back end, but I'm bashing my head against a wall
with the sound card. The problem may be asynchronous sampling
by the sound card, or it may just be my total inexperience with
programming for the sound card. I think it is the latter. I haven't
had time to pursue this extensively. I'm still looking for a good
tutorial on using the sound card for this type of work.

I'm using the PC VFO card as the LO, but as was noted here
recently, a VGA card makes a wonderful arbitrary function
generator working into the moderate MHz range. Since they
are cheap and common, I may pursue that if I ever sort out
the problem working with the sound card has posed.

4238. Question on HP 8555A - req. aux. 50 ohm termination?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-03 00:00:00 UTC
From: Stephen Schiller <schiller@adobe.com>
Message-ID: <71nrcrhln1@209.66.82.22>
Source record: 77443

Hi,

I just unpacked a HP 141T/8552B/8555A spectrum analyzer.
The manual for the 8555A warns me to install a 50 ohm
termination assembly on the auxillary A connector of
the display unit.
I don't have have this (and I'm not likely to find one soon).
Question: how will the lack of this termination
affect the operation/performance of the 8555A?

thanks,
Steve

wanted to build a Motorola MRF492 amplifier in 1986, but was told the
device was obsolete in Europe, would cost me $100.-

The MRF492 is a rather low gain device made for max 30MHz operation,
would believe several better devices have been made since 1982.
BLY94 is a better transistor (but quite old) with much higher gain, even
on 2m it has 60W o/p for 8W drive, but requires 24-28V supply.
2N6084 has 19.5dB gain as linear amplifier for 40W RF on 6m.

>> I am looking for information on a Six meter amp using a single MRF492 RF
>> transistor and an LM358 IC in the control/switching.

>> I am repairing this 10 in 80 Watt out amp for use on the V73SIX beacon.

It just does not make sense to use any antenna switching for a beacon!
I have built 15 beacons on different bands 30-2320MHz

If they are warning you to install a 50 ohm terminator you probably need it to prevent reflections of the signal. You can make what you need by soldering a 47 ohm resistor onto a BNC jack. When I have made these I get the kind of BNC connector that accepts a wire through the hollow center pin. Install the resistor instead of the wire, solder the other end of the resistor to the shell of the connector.

Any company that does networking will have them. They are used on thin
ethernet for terminations. Usually abt a buck..

4250. Signal generator matching question

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-04 00:00:00 UTC
From: CommQuart <commquart@erols.com>
Message-ID: <71r3bk$8$1@autumn.news.rcn.net>
Source record: 77207

There is probably an obvious answer to this question,
but my brain is foggy tonite (old age) and I haven't seen
the light.

Here goes:

My question concerns using a modern lab quality generator
with a 50-ohm output impedance to measure the sensitivity of
vintage receivers with 300 ohm, or higher, input impedances.

When using the dBm scale on the generator attenuator system, it
seems rather obvious that a matching balun is needed between the
generator and receiver antenna input. The dBm readings will be
correct only when the impedances are properly matched.

Now, when using the uV scale on the generator, it also seems obvious
that the generator will for most purposes deliver the same uV level
whether the input impedance of the receiver is 50 ohms or higher.

Big Question: Should a balun be used to match impedances when using uV?

Pete

This is correct. In old radios you used to see capacitors with the shaft mounted off center. This was an attempt to get a linear frequency curve, but it was never perfect.

A better idea would be to use a slug tuned coil. mount an extension shaft on the tuning slug with a reduction drive and knob. It will be more linear than the capacitor. I beleive this was called 'permeability tuning.

Perhaps I should have described the situation in more
detail for those who don't have the equipment I
am talking about. The connector in question is not a simple
BNC connector. It is a composite of 5 or 6 coaxial
connectors embedded in an inline connector. Three of
these should be terminated. These are outputs to the
8444A tracking generator. Such things as a 500 MHz
LO. The coaxial connectors are smaller than SMA, are
push-on, and don't fit anything I have laying around. They probably
fit something in my Newark catalog, but not sure what yet.

Given the large amount of surplus units around I had assumed
that someone out there has one of these 8555As and doesn't
have the termination assembly. So I was wondering
what the observed performance was in this situation.

Of course if anyone out there happens to have an extra
AT-4 termination assembly I would be interested in
buying it.

thanks,
- Steve

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman (KH2PZ / KH6)
(rec.radio.amateur working-group)

Now, now, I thought it would be a really big list fromthe many pointers given
in this group, I wasn't being
sarcastic, look at my statement above... :-)
I think it is great to have such a 'crystal exchange',
I have myself many hundred different xtals in different
cases, some from butchered equipment and some
new for homebrew projects ordered with slightly wrong specs,
I believe every homebrewer knows how it goes..
Btw, anyone with xtals in the European 80m CW band for sale
(3500-3550KHz preferably)?
Someday I will take the time to make a list of all the ones I have
and post here.

4261. FS:CR-60 input transformers

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-04 00:00:00 UTC
From: EC Therapy <docshok@sunlink.net>
Message-ID: <36403A89.232F@sunlink.net>
Source record: 77314

I have 14 of these. They are Calrad CR-60 "transistor transformer"
input transformers... 20,000 ohms/1,000 ohms. These are in the orignal
boxes, NOS. I am asking 15 bucks shipped to your door in the USA.

Thanks!

Paul

Ham crystals are additives used in the production of ham roll.May be
hazardous if taken in big quantities, gives trembling (oscillatory)
movements in the human body.
Additive E-768 in the EEC list of food additives.

I'll ltake that cigar. Many power supplies use two 200V caps in series. You use full-waverectification from 220V and a voltage doubler configuration from 120V.

Permeability is an interesting parameter, but a more useful number is inductanceper turn. You can easily measure this with an inductance meter. There are other interesting
numbers. Like the variation of inductance with frequency. And the variation of inductance
with current. Loss at RF frequencies.

>
>
> I'd also like to hear from anybody who's found an effective way to strap

> whose output can be controlled by changing the winding ratio on the output
> transformer.

This should be pretty trivial. Many PC supplies use the same regulator chip. 497 or some such.All you have to do is change one voltage sense resistor value and connect it to the output you want to regulate.

There are a few other things to worry about. If you regulate the 12V output and don't use the 5V output,
you're likely to over-voltage some of the 5V components and make smoke. Remove the 5V rectifiers.
The available 12V output is limited by the wire size. There's a very limited range of voltage adjustment
without creating some kind of loop instability. Rewinding the transformer is not trivial. Just
getting it apart and back together without cracking the core or changing the gap is tough.
You can't get all 300W out of it without changing
the sire size, rectifier ratings, filter capacitors...in short, redesigning the supply.

> Wouldn't it be GREAT to buy a 300 watt single-voltage DC supply at any
> voltage you like, for 25 cents?

Yep, 25 cents plus a few hundred bucks of time and effort. Maybe another few thousand in test equipmentand load fixtures to verify what you've got. Then there's the $1800 radio that smokes when
it overvoltages. Sounds cheap to me.

4264. How to determine optimimum C values for VFO

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-04 00:00:00 UTC
From: een8ld@electeng.leeds.ac.uk
Message-ID: <1998Nov4.095724.26558@leeds.ac.uk>
Source record: 77317
Cross-posted to: rec.radio.amateur.homebrew,uk.radio.amateur

Hi all,
I'm trying to build my own transceiver for 10m (to use as a transverter IF).
Initially I'm planning to build a (stable) VFO at 19.0-19.5MHz. How do I go
about choosing the optimum capacitor values, given, say, a 10-100pF variable
as the main tuning, to give a linear response of degree of turn vs. freq?

Linearity is due more to the shape of the vanes
as they unwind.

3-piece EDISON "Voicewriter" Wax Cylinder
Recording/Playback/Shaving System

The complete EDIPHONE office set, as was employed in state-of-the-art law offices in the late 1930's including 8 original Edison wax recording cylinders, most with hairline cracks but still usable in original soft-lined cartons. Recording unit comes with the original ceramic microphone (functionally restored) as shown and has a vacuum tube audio amplifier built-in to the unit which drives a ceramic recording stylus which etches the wax cylinder. The playback unit is similar to the recording unit except that it has a playback stylus and a mechanical sounding diaphragm to which a horn or earphone (not included) is connected. The cylinder shaver ("Master Shaver") is used to shave the surface of used or damaged cylinders in order to make them rewriteable. It functions like a small lathe. All three units feature very sturdy heavy-duty construction and have easy and intuitive stainless steel ergonomic controls which are characteristic of early shop equipment. Fractional horsepower Edison universal AC-DC electric motors are employed in all three units and all motors were cleaned and lubricated three years ago. The recording and playback units use adjustable flyball governors which stabilize the rotational speed of the cylinders. Fine pitch worm drives are used in each unit for steady stylus tracking. All three units can be brought to working order after the following repairs are performed: the paper sounding diaphragm on the playback unit is torn and should be replaced or rebuilt; the ceramic stylus on the recording unit is also internally damaged and needs to be replaced; the shaver needs a new shaving bit (which was originally a sliver of glass). All three units have the original paint and silkscreening which show signs of age.

Thanks, Reinhard

By joining the ARRL, you can't change anything. You will get a magazine
subscription.

ARRL membership are sheep. Just look at those in Director positions.
They are all in-bred.

You won't change anything, and all the sheep vote for the incumbent 99%
of the time (or don't vote at all). 1 vote means squat in the big picture.

Yes, fine, I have loads of both..The ones I want are the physically
bigger crystals, in HC6/U or FT243 case preferably.
They are better suited for valve transmitters, as some drive
quite hard current through the xtal, which cause smaller
HC/18 or /25 xtals to overheat and drift in frequency.
Anyone sell 'old rocks' in range 3.5-3.55MHz?

>They are all in-bred.

MOST volunteer organizations are the same when
it comes to getting VOLUNTEERS willing to put in
the time and effort needed for the position. I was national
president of a sports car club. I NEVER was opposed for
office AND my successor wasn't either.

>You won't change anything, and all the sheep vote for the incumbent 99%

That's the same bull that many people spout as to
why they don't vote in any election. The reality is that
every vote adds to the TOTAL and I've seen votes
as close as a handful that made the difference.

So I'll reiterate Marv, KC0EGB's post...

since the tuned range is only 2.6% of the frequency the VFO is likely to
be very linear. Cmax/Cmin= 1.053
The easiest way to make ultra linear VFO tuning is with inductive tuning
(permeability tuning).

Many thanks to everyone who replied to my request for help concerning diodes for a UHF diode probe.

The GEX66 diode mentioned in my original message is a germanium device featured in several circuit designs in 1970s RSGB books. Later editions of the same books show the same circuits using OA91 diodes.

I swapped the germanium diode in my probe for a IN4148 and this works FB at 70cms. Naturally it won't work on less than 0.7V, but so far this has not been a problem. If I need to measure less than 0.7V I'll change to one of the germanium devices recommended in your replies. The devices are reasonably cheap, but unfortunately most suppliers have minimum order charges, so I wait until I want several items before placing an order.

4281. Mizuhi VXO xtals (TT/Radcom 11/98 pp61)

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-04 00:00:00 UTC
From: la8ak@online.no
Message-ID: <3640aa26.8475430@news.online.no>
Source record: 77334
Cross-posted to: uk.radio.amateur,rec.radio.amateur.homebrew

G3VA mentions the Mizuhi rubber xtals.
Believe they are not much different from ICOM xtals for IC202 and 402, covering 200kHz segments on 2m/70cm, or the FM-mod IF xtals found in different transceivers. The xtal used with FT-901/901 is easily tuned 8975-9025kHz, and similar xtals are used by Finnish 'Salora' on 14.7 (VHF) and 15.7MHz (UHF) in SRP25 transceiver series.
Mizuhi certainly prefer to sell their own xtals, but production of such xtals is not much trade secret, several manufacturers know how to make them. The problem is when you try to buy an xtal from a manufacturer who don't know the reason for using rubber-type-xtals.

Another problem is amateur who believe they know everything worth knowing, so one ask them, and try out several manufacturers who may or may not be able to make the proper xtals.

Over 25 years old (HC6/U) overtone xtals are usually better in vxo's operated on fundamental series resonnant mode.

I am well aware of the circuit developped by Peter Parker (VK3YE), but sometimes one needs 'conventional' circuits.

You also seem to stick to conventional components and forget about the very useful ceramic resonators, they have far better coverage on 80m than the application mentioned by G3YUQ.

> ----------
> Note: My E-mail address has been altered to avoid spam
> ----------

A postscript -- Dan Rae came up with a good point in email, which was
that he'd seen excessive pulling of the 500 MHz LO when left
unterminated. There's no buffer between the oscillator and the output
jack, so anyone who leaves the output jack unterminated may have to
recalibrate the frequency of the 500 MHz LO to compensate. That, in
turn, can cause trouble if you ever do hook up an 8444A to the analyzer,
because then the LO frequency will be thrown off in the other direction.

So it sounds like the best advice is to terminate the 500 MHz LO, and
possibly the 47 MHz LO for the same reason, although I don't know if
that one's subject to the same frequency-pulling problem or not.

I have a '38 Special 30m QRP rig for sale.
It is 85 - 90% built. Has an onboard Tick keyer.
Comes with a small aluminum chassis,
all controls and connectors.
Documentation included.

I recently aquired this unit through a swap
however I've lost interest in completing it,
too many other things on the go.

Make an offer...

Sorry, this didn't do what I wanted the first time:

>G3VA mentions the Mizuhi rubber xtals.

Unfortately I didn't see the referenced article, but I have some experience wrestling with Mizuho crystals. I'll update here. If someone can transmit a copy of TT/Radcom 11/98 Page 61 to me, I would be ****VERY**** grateful, as you can tell below I have worked extensively on this problem/issue and would appreciate seeing another perspective.

>Believe they are not much different from ICOM xtals for IC202 and 402,
>covering 200kHz segments on 2m/70cm,

Proportionally, 200 kHz at 144 MHz is actually a narrower band segment than (say) the 50 kHz that the Mizuho MX-14S (20M) rig offers. I also think the 402 is double conversion, and not depend on VXO properties of the xtal (I do know the IC-202 is VXO, and the IC-502 is pure VFO).

>Mizuhi certainly prefer to sell their own xtals, but production of such
>xtals is not much trade secret, several manufacturers know how to make
>them. The problem is when you try to buy an xtal from a manufacturer who
>don't know the reason for using rubber-type-xtals.

As a point of perspective, Mizuho these days is just the original proprietor, holding forth in a very difficult JA economy. Manufacture of the three remaining MX-series hand-helds has been outsourced (40, 15, 6M) and the others essentially discontinued. There is also the possibility that the whip antennas are out of production altogether now.

I had some luck with International Crystal Manufacturers in Oklahoma City, Oklahoma, a few years ago. They describe the "rubbering" parameter as "motional capacitance", or C1 (as opposed to loading capacitance, or C), in their crystal parameters. When specifying C1, a higher C1 would cause the crystal to be MORE susceptible to pulling by varying load capacitance.

I had them analyze several Mizuho stock crystals in an attempt to clone the "formula". They then made these clones, and I would try them out. Eventually, some of the formulas worked reasonably well, but the actual range resulting from a given crystal would still vary from the intended range.

I also found out that the Mizuho 1/4W rigs (15, 10, 6, 2M) use a different IF and crystal formula than the other (1W) rigs.

Anyway, this cycle of crystal testing (it took 3-4 cycles working with an engineer at ICM) eventually produced some results, but nothing absolutely

repeatable.

So the results of this effort were some "new" ICM part numbers:

725677 (MX-2)
725680 (MX-7S)
725682 (MX-10Z)
725679 (MX-14S)
725678 (MX-15)
725685 (MX-28S)
725684 (MX-21S)

If you calculate the fundamental crystal freq (you have to do this, ICM won't be able to help here), then specify the above part number, you'll end up with a crystal that was our last attempt at a clone of a Mizuho crystal. They aren't as accurate as Mizuho stock crystals, but they are better than no specification at all (usually that results in a much-too-narrow working range - I have some JAN xtals for MX-21S that only cover about 1/2 of the desired working range).

After this cycle was done, some correspondence with a JA friend turned up the fact that Mizuho does alot of hand testing/picking of the xtals they supply, so in fact there is no great secret formula - the yield isn't 100% even for them.

The other thing was that ICM has since withdrawn their courtesy crystal analysis service, so I decided not to try any further getting xtals made. Therefore, if you try one of the above part numbers, and aren't happy with the working range, all I can suggest is that you try again, having them make the xtal with the parameters of the part number, but a different C1 parameter (higher or lower, depending on your experience).

Or, contact a JA exporter or friend going to JA, and buy real stock xtals. As it turns out, that's not a terrible option anyway, because the cost of the Mizuho xtal is reasonable (about the same as ICM).

>Another problem is amateur who believe they know everything worth
>knowing, so one ask them, and try out several manufacturers who may or
>may not be able to make the proper xtals.

As my info above tries to convey, there is more to this than trial and error, altho there is an element of that too.

>Over 25 years old (HC6/U) overtone xtals are usually better in vxo's
>operated on fundamental series resonnant mode.

You can still get HC6U package, altho the Mizuho uses a different package from this. I couldn't find any correlation between package and motional capacitance (C1) parameter - I think this may simply be coincidence.

>I am well aware of the circuit developped by Peter Parker (VK3YE), but
>sometimes one needs 'conventional' circuits.

I just wish Mizuho had done a double conversion design with a repeatable VFO range, rather than VXO with so many different crystals, but so it is.

Aside from the educational value, I would opt to modify a CB
radio to use as a transverter IF.
It would be much simpler and more econmical.
On top of that, building a stable 19 MHz VFO for SSB/CW use
is a challenge in itself unless you are planning on using a PLL/VCO
or DDS.

Cheers, Hugh VA3TO

I have a Yaesu FT-23R which came with an FNB-12 battery pack. Most of my friends tell me that their 23Rs on normal squelched receive last quite a while (many over 2 days) on the FNB-12 battery pack. Mine only lasts a couple of hours at the most, which makes me wonder whether the battery pack is coming to the end of its useful life.

Packs are quite expensive and I've been told a viable solution is to go to your local electronics store and buy the NICADs the pack needs and simply change them. I would like to do this and have already found a dealer which will sell the me the NICADs... only that I don't know how to start taking apart the battery pack.

A while back I had found a text file on how to take the Yaesu battery packs apart... but I seem to have lost it. Does anybody have this text or experience disassembling these battery packs?

Has anyone tried to modify the wavetek 3000 or 3001/A?
Seems the VCO runs on 1198-1740MHz (0.1-0.3V to PSD), could use a loose coupler (-10dB) and amplify the VCO signal to +10dBm, must build another level monitor, and feed the signal via a relay to the attenuator input.
At least it should be easy to make it cover the 23/24cm band.

for most of us 0.7V (in 50 ohm) is quite high level in the circuits we
check, it is almost +10dBm =10mW

In mid 60's 1N914 (later called 1N4148) was a very fine and expensive
device

Anybody?
I have been to Batlabs and they don't have any info on this subject.
Your help is greatly appreciated.

Please reply to dialogud@kennecott.com

David Feldman (dgf@netcom.com) wrote:
: Sorry, this didn't do what I wanted the first time:

: >G3VA mentions the Mizuhi rubber xtals.

: Unfortately I didn't see the referenced article, but I have some experience
: wrestling with Mizuho crystals. I'll update here. If someone can transmit
: a copy of TT/Radcom 11/98 Page 61 to me, I would be ****VERY**** grateful,
: as you can tell below I have worked extensively on this problem/issue and
: would appreciate seeing another perspective.

: >Believe they are not much different from ICOM xtals for IC202 and 402,
: >covering 200kHz segments on 2m/70cm,

: Proportionally, 200 kHz at 144 MHz is actually a narrower band segment
: than (say) the 50 kHz that the Mizuho MX-14S (20M) rig offers. I also think
: the 402 is double conversion, and not depend on VXO properties of the
: xtal (I do know the IC-202 is VXO, and the IC-502 is pure VFO).

: >Mizuhi certainly prefer to sell their own xtals, but production of such
: >xtals is not much trade secret, several manufacturers know how to make
: >them. The problem is when you try to buy an xtal from a manufacturer who
: >don't know the reason for using rubber-type-xtals.

: As a point of perspective, Mizuho these days is just the original proprietor,
: holding forth in a very difficult JA economy. Manufacture of the three
: remaining MX-series hand-helds has been outsourced (40, 15, 6M) and the
: others essentially discontinued. There is also the possibility that the
: whip antennas are out of production altogether now.

: I had some luck with International Crystal Manufacturers in Oklahoma City,
: Oklahoma, a few years ago. They describe the "rubbering" parameter as
: "motional capacitance", or C1 (as opposed to loading capacitance, or C),
: in their crystal parameters. When specifying C1, a higher C1 would cause
: the crystal to be MORE susceptible to pulling by varying load capacitance.

: I had them analyze several Mizuho stock crystals in an attempt to clone
: the "formula". They then made these clones, and I would try them out.
: Eventually, some of the formulas worked reasonably well, but the actual
: range resulting from a given crystal would still vary from the intended
: range.

: I also found out that the Mizuho 1/4W rigs (15, 10, 6, 2M) use a different
: IF and crystal formula than the other (1W) rigs.

: Anyway, this cycle of crystal testing (it took 3-4 cycles working with an
: engineer at ICM) eventually produced some results, but nothing absolutely
: repeatable.

: So the results of this effort were some "new" ICM part numbers:

: 725677 (MX-2)
: 725680 (MX-7S)
: 725682 (MX-10Z)
: 725679 (MX-14S)
: 725678 (MX-15)
: 725685 (MX-28S)
: 725684 (MX-21S)

: If you calculate the fundamental crystal freq (you have to do this, ICM
: won't be able to help here), then specify the above part number, you'll
: end up with a crystal that was our last attempt at a clone of a Mizuho
: crystal. They aren't as accurate as Mizuho stock crystals, but they are
: better than no specification at all (usually that results in a much-too-
: narrow working range - I have some JAN xtals for MX-21S that only cover
: about 1/2 of the desired working range).

: After this cycle was done, some correspondence with a JA friend turned up
: the fact that Mizuho does alot of hand testing/picking of the xtals they
: supply, so in fact there is no great secret formula - the yield isn't 100%
: even for them.

: The other thing was that ICM has since withdrawn their courtesy crystal
: analysis service, so I decided not to try any further getting xtals made.
: Therefore, if you try one of the above part numbers, and aren't happy with
: the working range, all I can suggest is that you try again, having them
: make the xtal with the parameters of the part number, but a different C1
: parameter (higher or lower, depending on your experience).

: Or, contact a JA exporter or friend going to JA, and buy real stock xtals.
: As it turns out, that's not a terrible option anyway, because the cost of
: the Mizuho xtal is reasonable (about the same as ICM).

: >Another problem is amateur who believe they know everything worth
: >knowing, so one ask them, and try out several manufacturers who may or
: >may not be able to make the proper xtals.

: As my info above tries to convey, there is more to this than trial and
: error, altho there is an element of that too.

: >Over 25 years old (HC6/U) overtone xtals are usually better in vxo's
: >operated on fundamental series resonnant mode.

: You can still get HC6U package, altho the Mizuho uses a different package
: from this. I couldn't find any correlation between package and motional
: capacitance (C1) parameter - I think this may simply be coincidence.

: >I am well aware of the circuit developped by Peter Parker (VK3YE), but
: >sometimes one needs 'conventional' circuits.

: I just wish Mizuho had done a double conversion design with a repeatable
: VFO range, rather than VXO with so many different crystals, but so it is.

: 73 Dave WB0GAZ dgf@netcom.com

One hint...those radios use 60 PF capacitance, rather than the more 20 or
32 PF ones that most gear uses.
I have 2 of the 10 meter units(AEA DX-Handy)(1.5-2.0 watts)these are
the hand-held Mizuho units-and I forget which xtal corp I used(it MIGHT
have been Crystec), but they had NO problem making me some custom xtals
for my units-and they performed every bit as good as the stock xtals.
They had all of the data on the radios already on file!

> 0.6V rather than 0.7V...

It depends on the current. The voltage drop of a diode is a logarithmic function of the current through it. At zero current, the drop is zero, and it increases to 0.6 - 0.7 volts at moderate current levels of a few mA. However, it doesn't rectify well at low levels because the reverse characteristics are nearly the same as the forward characteristics at low levels, so it looks more like a resistor in this region.

I vote in the primary. I vote to get rid of the weasels.

I never vote in a general election. After the primary, I don't
really care who wins. If your candidate loses the primary,
it really doesn't matter who wins. Jack-Ass or GOP, they both
are part of the 5 Trillion dollar problem.

In Oregon, you don't have to vote anyway, as the candidates
are already elected before the polls open.

I agree about the butane soldering irons. In the Tech America flyer that came in today's mail, I see they have the Iroda Pro-120 marked down $20 to 39.99. You might check them out. Since Tech America and Radio Shack are both part of the same company, you can probably pick up the same thing at your local radio shack.

Tap on one side of the seam to break it apart all the way around with a small flat blade screwdriver. You should be able to tell which side is lapped over which and tap on the lowerside of the seam.Easier done then discribed. When you go to reassemble it, you could chemically weld it back together with a small amount of MEK(methol-ethal-keytone) if you like, by clamping the pack together and applying small drops IN the seam and let dry..about a couple of hours, till it hardens.If there is a big gap it can be filled with some old black plastic dissolved in a little bit of MEK and used like glue..Hope this helps..73

For Sale: Vectron OCXO model 216-5922, 5 Mhz. Power to operate is 28VDC at a couple hundred ma. Unit will operate at 12vdc, but the oven warm up time is somewhat longer. These units are new and exhibit stability in the few parts in 10E-8. I do not have any other data on the units. Dual signal outputs via SMA connectors. Power is via a 7 pin male connector like a 7 pin vacuum tube. Power connections are noted on the unit. I have 7 units available at $40 each post paid conus

In addition to the unit above, I have the following OCXO's. All require 28VDC except the 11.520 mhz with is 12vdc and has mechanical as well as electrical frequency setting via a trimpot. All units are post paid conus.

Austron:
52.00Mhz 3ea $13 each post paid
11.52Mhz 4ea $13 each post paid
47.0Mhz 2ea $13 each post paid
56.266666Mhz 2ea $13 each post paid

A correction:

This is true. With no xfmr the 50 ohm gen must be set to a higher value, about 7.8 dB, than with an xfmr, whether in terms of dBm or microvolts, for the same rcvr output. I misunderstood this paragraph.

The rest is OK. With an xfmr, read the dBm scale directly and for microvolts multiply the meter scale by 2.45.

> The transformer does not change the dBm value. That is, the available power,

>apart the battery pack.

You might also check to see if you can find a battery specialty place
that rebuilds complete packs. They open up the pack for you, install
all new cells welded together, and put it back together - generally for
less than it would cost for you to buy just the cells from an electronics
place.

Some of this is probably the cells themselves. Rebuilders use industrial
cells with no fancy labelling, and no solder tabs. They have their own
welding machinery, and weld the cells together in whatever physical
shape and electrical connection required.

Without the welding equipment, you can't do this yourself. You can't
solder to untabbed NiCd cells - the heat damages the seals. So you
have to buy cells with solder tabs already welded to the cells, and
that seems to add significantly to the cost. Then you solder the tabs
together to make your pack.

Using a CB radio would limit you to operating in a channelized mode. If you wanted to operate on 2 mtrs on the designated calling frequencies (144.2 MHz I believe) you may have a problem.

I don't know what you will get, but it will not be a 7 MHz crystal.

Things like this are sometimes done to produce a filter, but it will still be somewhere around 10 MHz.

If you are talking about equal value components, resistors divide when in parallel and add when in series. That is two ten ohm resistors, for example, in parallel will result in 5 ohms, and the same two resistors in series will give 20 Ohms.

Capacitors are just the opposite. Two equal capacitors in parallel will have twice the capacitance. In series they will have half the capacitance.

Inductors behave the same way as resistors if the have no magnetic coupling between each other. If they do, then they form a transformer and the situation is more complicated.

FOR SALE BY PRIVATE PARTY;

Quantity 10, Amperite 3TF4 ballast tubes.
T 6 1/2 glass bottle, standard 9-pin minature base.
Guaranteed New Old Stock

This is a ï¿½current regulating resistorï¿½ (it says so on the box). Some are in red, white, and black Amperite boxes, some are in JAN boxes.

I experimented with a couple to find out how well they ï¿½regulate currentï¿½, and I was impressed with the degree of regulation. These provide a relatively ï¿½constantï¿½ current of around 300 mA.

Tube dealers are selling these for as much $10 each (check out the online tube sellers and see for yourself). Iï¿½m selling all 10 as a lot for $75, and Iï¿½ll pay First Class Shipping (prepay by money order, continental US 48 only, please).

Respond by email if interested,

Germanium diodes work extremely well at low levels but are getting rarer
try an AA119 they work well at low levels up to and beyond 2Ghz (probably).

If building new use a Schottky diode, they come in many forms and most seem
to detect very low signals well into the Ghz region, and are still only
about a pound each new ! The HP Schottky diodes are extremely good
(HP 5082-2810 ?)

Basicaly build the probe and try a selection of available diodes, it's
hardly going to break the bank even if you buy them new ! Dont forget
their response to power becomes non linear as the input power increases.
Don't miss out on trying junk box diodes some of them can be very good !
A 1N4148 will work supprisingly well !

Still a very usefull tool though !

> with a 50-ohm output impedance to measure the sensitivity of
> vintage receivers with 300 ohm, or higher, input impedances.

If you are going to use a 50 ohm antenna, the sensitivity should be measured with a 50 ohm generator, with no transformer. In practical operating, the mismatch makes very little difference, as observed on my 200 ohm HQ-129X.

To verify rcvr mfr 300 ohm specs, use a 2.45 turns ratio transformer. To check sensitivity the rcvr input should "see" 300 ohms.

> When using the dBm scale on the generator attenuator system, it
> seems rather obvious that a matching balun is needed between the
> generator and receiver antenna input. The dBm readings will be
> correct only when the impedances are properly matched.

The transformer does not change the dBm value. That is, the available power, which is what the dBm scale indicates, does not change (if the transformer is lossless). This is a good feature of dBm usage. But when the xfmr is installed the required dBm reading for sensitivity will decrease slightly because of improved Z match between gen and rcvr.

> Now, when using the uV scale on the generator, it also seems obvious
> that the generator will for most purposes deliver the same uV level
> whether the input impedance of the receiver is 50 ohms or higher.

For a given value of dBm, the microvolts delivered to the receiver increases. For a 50 ohm to 300 ohm transformer the turns ratio is sqrt 6, which is 2.45, so1 microvolt meter reading becomes 2.45 microvolts at the rcvr input.

> Big Question: Should a balun be used to match impedances when using uV?

The rcvr should (in principle) see 300 ohms when measuring sensitivity for a 300 ohm antenna. So, just multiply the meter microvolt reading by 2.45 when using the 6:1 impedance ratio xfmr. Or, better yet, forget microvolts and use dBM, which is the "modern" way of specifying.

This thread seem to have quite a few diode experts, so I have a question to ask while they are here. I have some diodes that are little glass types similar in appearance to a 1n4148. These are marked ITT 317 05 3. I put a little current through and got about .25 volt at 1 ma. I couldnt find any data on the part number so I guess they are house numbers. Does anyone have a guess what they might be, or if they are probably schottky diodes or germanium types?

Don

Hello, I have the following Amateur radio tubes for sale. All are NOS
in the original box unless stated otherwise. When possible, (some tubes
can only be tested in curcuit) tubes are tested with a Hickok TV-7D/U.
I have a vast amount of tested, miniature tubes for your recievers,
transmitters, test equipment, etc. at very reasonable prices. Also have
a pretty huge stock of all types of NOS tubes, please inquire about things
not appearing on any of my posts. I'm in the midst of learning how to
set up a website, perhaps in this life :o)... Shipping extra, runs only
3.00 and up, whatever the post office charges...insurance is only a buck
or so, depending on the market value for the particular item(s).
The large transmitter tubes have been checked via ohmmeter.
I will only shipped these fully insured.
Of course, i'll guarantee them to work properly, so PLEASE TEST CAREFULLY
IMMEDIATELY apon arrival, and if it doesn't do what you like, just send it
back right away for a prompt refund,(in original,shipped condition) less return

shipping charges. If defective, I'll absorb initial shipping costs.
Thanks,
if interested, drop me a line... 73's
Joe Pratt, Tubecntral@aol.com

No. The resonant frequency of a crystal is determined by the physical characteristics of the individual crystal. Connecting multiple crystals either in series or parallel will affect how steep of a resonant effect you get, but it won't affect (much) the frequency at which it happens.

I assume you mean a *commercial* license. Really there aren't many jobs
for which it's needed anymore either. (though there are some) I really
can't think of any other good reason to have one.

It might be a good thing to have on your resume when you're applying for
a job that doesn't require the license. My current boss considered my
amateur license when he interviewed me - and the amateur license
certainly isn't required for my job!

By chance, did you happen to do the out-of-band mod that gives you 220
Mhz? I have read cases where usage there can cause a PIN diode to give
out and the result is a loss of 6 meter tx. I guess the circuit tuning
is so far out of resonance on 220, that the reflected power is to blame.

Shelley, let me fill in the blanks. Doug assumes you are talking about a commercial license, because an amateur license *cannot* be used for business-related purposes. Consequently, no employer could require you to have one.

Now - perhaps you really were asking about amateur radio licenses, and wanted to know why people get them. It's a hobby, pure and simple. We enjoy learning about radios and how they work, learning how radio waves travel, and investigating all the various things that can be done with radio. One might ask why, in this day and age, we choose to use 2-way radios instead of cellular phones. It's probably somewhat analogous to riding horses. There are plenty of people who ride and enter riding contests of all sorts, even though cars have long-since replaced the horse as our primary mode of personal transportation.

I'd be happy to answer further questions if you have any.

Bob, KI8AB

P.S. One word of warning - the newgroups are full of people who love to insult and argue. If any such people respond to your posting, I suggest you simply ignore them.

4349. Help lettering a front panel

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-05 00:00:00 UTC
From: Rick Mintz <Rmintz@frontiernet.net>
Message-ID: <3641E194.EFF39CD9@frontiernet.net>
Source record: 77244

Hi.

Am completing a QRP station (xcvr, tuner, heterodyne notcher) which is being housed in a carved wooden box.

I want to avoid lettering the panel knobs with white labels from my laser printer. Would not look good enough.
Trying to determine what other method would look nice. Transparent film is no good as the wood is a dark
color. Also don't have access to a scribing machine.

Well homebrewers, any ideas?

Rick, W1TY

Do your _entire_ front panel paper on a laser printer, including a
nice logo - use any color paper you like. Cut a piece of clear plastic
(1/16 inch plexiglas from hardware store) to fit over it. Make the
cabinet the "hooded" type in which the top and sides extend out a bit
from the front panel so that you cover the edges of the paper and
plastic.

Anyone knows where I can get datasheets (or just data) for the 2SC2166 and the 2SC1973?? I am mainly interested in Zin/Zout, Power in / Power out for 10M operation.

thanks!

Costas / KE6SYN

4352. Re: Varactor Diodes

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-05 00:00:00 UTC

Message-ID: <3641F535.BAF139E8@teleport.com>
Source record: 77247

The Alpha data book I've got shows DKV6520-00, -06, -12, -18, and -24, but no B suffix. They differ somewhat in specs, but all are about 20 pF at Vr = 4V, about 8 pF at 8V, and about 3.5 pF at 20V. (Some in the series have reverse breakdown voltages less than 20V so aren't rated there.) They're hyperabrupt diodes.

And you can polish up the edges with plain old time screen wire!
Made more than a couple of 4-400 and 4-1000 glass chimneys from
glass jugs. But that was the good 'ol days!

: diodes or germanium types?

Yep, probably Schottky or germanium with that low a forward voltage. If you check the current at some different voltages, you could verify that they follow the diode equation, I = I0 * (e^(nqV/kt) - 1). You can put your readings into a spreadsheet and look at the errors, and figure out what n is for these diodes. (Expect n to be between 1 and 2; the ones I've bothered to check seemed to all be near 1.) If you get something that fits very well at low currents, it will probably be pretty accurate all the way to zero and somewhat negative voltages. In addition to the intrinsic diode, there are parasitics: series resistance and inductance, and shunt capacitance, to begin with.

: Check the 'multimedia' section of www.winfiles.com. There are a few programs
: that
: do sound recording.

I use Cool Edit, which makes it easy to record through the sound card, but
if I'm not mistaken, there is a simple recorder application included with
Windows95. The convenience of having several buffers that you can access
with function keys sounds nice for this application, though (as posted
by someone else).

: I always thought that the forward voltage drop of a silicon junction was
: 0.6V rather than 0.7V...

They don't just suddenly "turn on" at some magic voltage. They should
follow (at low currents where you can neglect parasitic series resistance)
the diode law, I = I0 * (e^(nqV/kt) - 1). In other words, the current
is exponential with voltage, and passes through 0 current at 0 volts
(unless you shine light on the junction!). The result is that you can
get useful rectified output well below that "0.6 or 0.7 volts" input.
I can "see" the output of a detector with less than 100 _micro_volts input
at 2 meters...this particular detector diode drops about 0.2 volts with
about a milliamp thru it. So with a standard silicon diode, I'd expect
to be able to "see" under a millivolt of RF. However, the detector DC
output will be in the very-few-microvolts level for that low an input.
You need a stable, sensitive circuit to measure the output.

See the HP ap notes on zero-bias detectors that I pointed to earlier in
the thread; they point out (as I recall) that for signals a little below
that "0.6 to 0.7" volts, the detector output _voltage_ is linearly
proportional to the detector input _power_ (assuming the power is
in a resistive load like 50 ohms). So if you measure 0.1 volts at,
say, 0dBm into 50 ohms, then you'd get quite close to 0.01 volts at
-10dBm, and 0.000001 volts at -50dBm. If you have a voltmeter good
enough to resolve 1 microvolt, you could well be able to use your
1N4148 detector down to that sort of level.

Subject:
Another BIG list of HAM TUBES F.S.(11/4/98)
Date:
5 Nov 1998 15:33:49 GMT
From:
tubecntral@aol.com (TUBECNTRAL)
Organization:
AOL http://www.aol.com
Newsgroups:
rec.radio.amateur.homebrew

Hello, I have the following Amateur radio tubes for sale. All are NOS
in the original box unless stated otherwise. When possible, (some tubes
can only be tested in curcuit) tubes are tested with a Hickok TV-7D/U.
I have a vast amount of tested, miniature tubes for your recievers,
transmitters, test equipment, etc. at very reasonable prices. Also have
a pretty huge stock of all types of NOS tubes, please inquire about
things
not appearing on any of my posts. I'm in the midst of learning how to
set up a website, perhaps in this life :o)... Shipping extra, runs only
3.00 and up, whatever the post office charges...insurance is only a buck
or so, depending on the market value for the particular item(s).
The large transmitter tubes have been checked via ohmmeter.
I will only shipped these fully insured.
Of course, i'll guarantee them to work properly, so PLEASE TEST
CAREFULLY
IMMEDIATELY apon arrival, and if it doesn't do what you like, just send
it
back right away for a prompt refund,(in original,shipped condition) less
return

shipping charges. If defective, I'll absorb initial shipping costs.
Thanks,
if interested, drop me a line... 73's
Joe Pratt, Tubecntral@aol.com

! can't fault your calculations. The VHF UHF Manual 4th edition shows a power meter consisting of a diode and voltmeter connected across a resistor RL. The value of RL is 75 or 50 ohms as required. The formula quoted for power output is (V+0.7)SQUARED/100 for a silicon diode, or (V+0.2)SQUARED/100 for a germanium diode. It also shows a graph plotted using this formula. This sounds wrong to me. Sould not 100 be 50 or 75? Am I falling into the old trap about power being shared between load and source, or is there another explanation?

Not recommended! I have one of these for my rare
excursions onto 2 metres - calibration to find the
calling frequency is difficult; if someone says "go
up 30", you have to make sure that he calls you,
else your QSO will end prematurely when your version
of 30kHz is different to everyone else's!

However, nice easy rig to maintain, no weird IC's
except for audio amp, but that's an easy one
to replace with a non-equivalent. Plenty
of space for a soldering iron inside.

However, might be a candidate for a DDS vfo.......

perhaps not so simple, diode rectifying effectivity is another problem,
quote:
Subject: Re: 1N4148 as RF detector?
From: mud@rtrower.com (mud)
Date: Thu, 11 Dec 1997 01:55:18 GMT

Those results aren't too surprising. The typical
1N4148 has about 4ns of reverse recovery time. That's an
appreciable fraction of a cycle at VHF, and will lead to
quite low rectification efficiency.

Hi

Can you not obtain some brass bolts m3 cut them to required length and
then cut the head off and cut a small groove in the top to make them
adjustable, if you cant find any let me know what length you want after
decapitating and I will have a look in spares stuff for you, drop me an
email and I'll try to sort something out for you

John,

Don't hesitate to ask the Alpha folks for help with your problem.
I've worked with them in the past, when trying to improve
phase noise performance of an oscillator. They know which types
of varactor are best. (For my needs it was abrupt junction,
epitaxial, with thermal compression lead bonding, if I remember
correctly.)

Hi,

I've been following this thread with interest. My question has not been answered so I'll ask it now. In the service manual for my R-71A signal levels in the alignment section use "dBu". This is something I am not familiar with. I have used dBm and micro volts for many tears and can easily one from the other. Is anyone familiar with dBu ?

Thanks,
Dick

I use AutoCAD to lay out the panel. Since it matches
the mechanical design, the panel fits.
Stick the front panel in a flatbed plotter and
plot the front panel onto the aluminum. Seal it
with clear laquer or overlay with plastic.
Works well when line-drawing is adequate. Not
good for graphic images.

4369. Help using PLL to replaced Crystal

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-06 00:00:00 UTC
From: Douglas Berry <dberry@wcl.on.ca>
Message-ID: <71vkn7$9mc$1@nntp1.uunet.ca>
Source record: 77114

Hello to All

I have a number of different 6 meter radios around. All of them crystal controlled. The only problem is crystals are expensive and you need a new set for every channel. I have been playing with (on paper) the idea of replacing the exciter boards with a PLL synthesizer. A Motorola chip MC145151 looks very promising. It has a parallel input that allows the reference to be divided by fixed numbers and the VCO can be divided by 3 to 16383. My Question is, is this possible. Has anyone ever built a PLL synthesizer to replace a Crystal in an old radio. Any suggestion or comments what ever, would be appreciated. Please drop me an Email as I don't always find time to check the newsgroups.

Thanks for now
73 de Doug VA3DMB

"only" problem is distorted audio; remove the bias resistor on product
detector and the two balancing capacitors (20pF?). I worked several
hours to improve the agc, only to discover that the problem was product
detector circuit, modified another TR-7010 and worked almost as fb as
mine, without agc modification. LA7BI mentioned a similiar problem with
FT-726, product detector sounds distorted....

I have never used that term, but it is probably "dB with respect to 1 microvolt".

dBu = 20 * log (V/1microvolt)

A 0.5 microvolt signal would be -6 dBu.

A.C. you're on your own in this. Here's something to ponder:

Hams help nab Connecticut jammer

It took a group of ham radio operators to finally track down an alleged jammer that had been plaguing Connecticut police communications for some time. It all took place near the Leagues' home town. Again, Rick Lindquist of the ARRL Audio News:

A Connecticut Amateur Radio tracking team called Capitol Region Malicious Interference Tracking, CRMIT helped lead authorities to a man they believe was interfering with local public safety communications. Wethersfield, Connecticut, police arrested Joel Langdo of Hartford September 29. He's been charged with criminal mischief, interfering with police and breach of peace. Langdo also could face similar charges in other communities as well as federal charges.

Langdo, a security guard who does not hold an amateur license, allegedly used a modified ham radio hand-held to transmit on police and fire frequencies used by as many as three dozen Connecticut public safety agencies. At one point, he is said to have jammed the Manchester, Connecticut, police system for 15 minutes.

Tracking down Langdo took several months of often grueling detective work and careful documentation of offending transmissions, according to CRMIT spokesman Bruce Marcus, WA1NXG, an ARRL Life Member who's in the land-mobile business. Last April, Manchester Police solicited help from CRMIT, which, in turn notified the FCC. CRMIT helped Manchester authorities solve another malicious interference case several years ago.

Marcus said the jammer used a modified Yaesu FT-50R dualband hand-held for all of his escapades, which included playing music, airing sound from TV sitcoms, making moaning sounds, and recording and playing back police transmissions. Because the complaints were widespread, Marcus said it was not clear at first that the jamming incidents were related.

The CRMIT team used sophisticated transmitter fingerprinting equipment, and the offender helped to capture himself, Marcus said. "Its unique signature nailed it."

The offender also had a habit of broadcasting Tchaikovsky's Nutcracker Suite and certain DTMF strings.

The CRMIT team eventually was able to track transmissions to the building where Langdo lived. Marcus said federal authorities are looking into how Langdo got the radio illegally modified to transmit outside the amateur bands.

Langdo was taken into custody on September 29th.

(ARRL)

Hmmmm.
"Federal authorities are looking into how Langdo got the radio illegally modified to transmit outside the amateur bands."
Certainly not from this newsgroup!

>

A ham fried of mine had a T8A and I had the opportunity to test it out. One of the things that he was interested in was 220 performance, since we use 220 in my area (Nothing like getting a free band by just making one little cut). Unfortunately the 220 performance was nothing short of dismal. The receiver was all but deaf, even with a 220 antenna on it. I measured the sensitivity, and it took over 1 mV to open the squelch. The transmitter seemed a bit better. While it didn't come near the 5 watt rated output on the other bands, it did do about 1 watt, which was enough to bring up the local repeaters. I didn't think to look at the output on the spectrum analyzer. I didn't know it was that bad at the time. That was before I heard about the possible damage that can happen by transmitting on 220. I guess that because the circuit resonance is so far out on 220, and combined with the standard antenna that is not cut for 220, that the reflected power in the transmitter is enough to overload the PIN diode and kill it.

It's still a nice radio, and it's ok to do the out of band mod, but just don't transmit in the bands that are far out of its designed range.

> Brian/N0iMD
>
a little off the subject of my query.

my intentions were to use the t8a for qrp 220 since there is an
excellent
220 repeater in my area. i made no claims of mars/cap [to xplain why i
modded]
when asking my question if anyone had info on why it no longer tx'd on
6m.

i pride myself in maintaining good sounding/operating equipment and do
check
for harmonics/over deviation etc. i own/maintain a multi-cast repeater
system
so i wouldn't like anyone jamming/messing with my bandwith either.
442.45 and 53.45
[thought about adding 220 but probably not now that i've killed the t8]

i just wanted to see if i could gain 220 operation without buying
another rig.
it blew the pin diode obviously to find out. that's life in ham radio
;-)

i've got this giant sized blood bag sealing machine that uses a
itt/triton 6366
tube that i'm going to build into an hf amp. i'm no genius at
hombrewing but
i do take care to make sure my neighbors don't get interfered with my rf
output
on the bands i frequent whether it's with an untouched or modified
radio.

thanks for all the replies from this group.
problem with t8a located and resolved.

4377. EPROMs 27xxx vs. 27Cxxx ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-06 00:00:00 UTC
From: Pete Dziomba <n2mci@ulster.net>
Message-ID: <3643AB49.1E8B@ulster.net>
Source record: 77122

Can anyone tell me what the difference is between 27xxx and 27Cxxx Eproms, other than the 27C uses CMOS tech. vs. some other tech. type and probably requires less power to operate. I have several 27256's in my junk box.. I used one last week where a 27C256 was and everything seems to work fine? The access speed were both 250ms.. Pete n2mci@ulster.net

4378. ??what to do with old pagers...

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-06 00:00:00 UTC
From: goodmich <goodmich@isu.edu>
Message-ID: <364382A8.FB22A3FF@isu.edu>
Source record: 77123

I just acquired half a dozen old pagers. For the most part they are all operating on the 158.700 frequency range. Most of them are just beepers, but I have a couple that have voice as well. What can you do with a pager or pager parts? With some creativity could I rig some sort of tuner? Is it possible to actually make a transceiver with a modest investment in additional parts? How bout squelch, and some of the other incites?

Any wild ideas would be appreciated.

Thanks

Yes, thank you for restating that, Jan-Martin. It says the same thing,
but in a different way that more people may be able to understand.
As far as I know, that relationship is valid for any diode that
follows the exponential diode equation. (In fact, I once verified
it just using the diode equation and an Excel spreadsheet.)

: In 1978 LA1TN and I tested forward biassed (15uA) 1N914/1N4148 as
: detectors*) up to 500MHz, one diode for detector, the other for
: reference. The lower limit RF was -50dBm. The circuit (using 5x uA741)
: was rather unstable, it was difficult to avoid temperature drift from
: the diodes (very tight temperature coupling is important), and a later
: RF mV meter using 2x1N270 had much better detected voltage vs frequency
: response over the tested range, 0.010-600MHz

Yes, amplifier stability is very important. I'm having good luck with:

1) a digital voltmeter with good sensitivity (like 1uV per "count")

and (or?)

2) a chopper stabilized op amp (one from Harris) which has ~ 1uV input
offset error and also has low about 1pA input bias current. (Note
that running that op amp at a gain of 1000 only gets you to a
millivolt or so for a microvolt input! So following that, you want
another amplifier with very respectable input offset, not a cheap
amp that might have 10mV offset! However, the chopper stabilized
amps have high enough DC gain to be useful to greater gains even
than 1000; just don't expect a wide frequency response.)

In another contribution to this thread, someone mentioned putting a low resistance load on the detector, I believe. Since the detector output current will be very small at low input voltages, that is NOT a good idea for a sensitive detector! Put a 50 ohm resistor as a load for the _RF_ (if that's the RF load you want), and then run a small capacitor like 100pF from the "hot" end of the RF load resistor to the diode cathode. Diode anode grounded. Put about a 1 MEGohm load to ground! You can put an RF filter from the diode to the point where you connect your measurement circuit. A simple 100k resistor in series and 0.01uF to ground works pretty well. You can also arrange to put a little DC bias current through the diode, and compensate the voltage drop with the same bias current through a "sister" diode which doesn't see the RF. See the HP ap notes I referred to earlier for discussions of optimal load impedance for the detector itself, and keep that separate from the RF load resistance!

Although something like a 1N4148 may have a rated reverse recovery time of 4nS, that's from a specific forward current, to sweep out the stored charge. If you are operating at a much lower forward current, there is much less stored charge, and I believe that such diodes are still useful as detectors even where the cycle time is shorter than that rated reverse recover time. It is an indication, though, that there's going to be a limit to what you can do!

Pete,
The "c" is for CMOS the non "c" are TTL. TTL will draw more power and be capable of driving more loads. A CMOS low output is usually guaranteed to be no higher than 0.3 volts while a TTL is 0.7 volts. A CMOS high is usually guaranteed to be no lower than about 0.5 volts below Vcc while TTL will be about 3.7 volts min. The input high/low thresholds are different as well. CMOS driving TTL will usually work fine but TTL driving CMOS leaves a very small noise margin.

In general mixing and matching is not advised for a REAL design. However, with that said, if your unit is functioning and the power supply can handle the extra current go ahead and use em.

Hello--

I'm offering another (but larger and less expensive) batch of microwave-grade printed-circuit board laminate. My hunch is that this batch will sell quickly, so order soon to avoid disappointment<g>.

73,
Brad AA1IP

****

Rogers RT/duroid 5880 microwave-grade printed-circuit laminate for sale: consists of two layers of 0.5-ounce rolled copper foil bonded onto a 0.031-inch core of glass microfiber-reinforced Teflon (tm) dielectric. A layer of transparent peelable plastic file protects each copper surface, rendering the copper shiny and probably ready to etch as-is.

Each board carries a Rogers label and measures 8.125 inches by 12.125 inches. Detailed specifications are available at the Rogers web site: http://www.rogers-corp.com

Dielectric constant K= 2.20 (typical)+/- 0.02
Dissipation factor at 10 GHz (tan delta)= 0.0009

Price: $10.00 per piece; or $20.00 for three pieces, plus $3.75 for insured priority-mail shipment (U.S. only). Canadian purchasers, please inquire for postage.

***

Also available: Rogers RT/duroid 5870 microwave-grade SINGLE_SIDED printed-circuit laminate: one layer of 0.5-ounce rolled copper foil bonded onto a 0.031-inch core of glass microfiber-reinforced Teflon (tm) dielectric. A layer of transparent peelable plastic file protects the copper surface, rendering the copper shiny and probably ready to etch as-is. Each board carries a Rogers label and measures 8 inches by 9 inches.

Price: $5.00 per piece; or $10.00 for three pieces, plus $3.75 for insured priority-mail shipment (U.S. only). Canadian purchasers, please inquire for postage.
***
Shipment restrictions:

Please note: this material is for sale to Canadian and U.S. purchasers only. Foreign shipments of unfabricated RT/duroid require an export license and may be subject to shipping restrictions.

I accept payment via personal or cashier's check or money order drawn in U.S. dollars and made payable to "Brad Thompson".

Warranty policy:

If you purchase these boards and find them unsatisfactory upon your visual inspection, you can return your unused boards in as-received condition for a full refund within seven days.

This material is subject to prior sale and is supplied as-is, as new-old-stock (NOS) merchandise, with all responsibility for safe and successful application residing solely with the purchaser.

Try using the tuning capacitor from an old VHF FM broadcast receiver.
As you only need to tune the VFO over a few percent, you should get
fairly linear tuning. It is not easy to build a stable VFO at 19MHz.
It will probably be more difficult if you use permeability tuning, with a
ferrite or iron powder core.

In my H/B HF rig, the VFO uses a good quality, double bearing type
VHF tuning cap. The inductor is wound on a grooved ceramic former,

made from an old 1KW electric fire element (don't try to drill holes in it).
Frequency stability is quite good on most bands, but not on 20M and 10M
where the VFO frequency is over 22MHz. I use a digital stabilizer and
frequency display (Elektor Mag. Feb 98) to keep it under control.

Good luck with the project, keep the soldering iron hot.

A more practical answer....

Aluminum and Stainless Steel work well together. That is what most all antenna manufacturers use.

Shelly, the answer is no! if you are not going to use the license there is no practical reason to have one.. However, many companies give credit or preference for an FCC license even tho the job does not require one. it tells them that you have successfully passed a legitmate electronics test. I have been licensed since 1950 , have worked for years without needing the license,then along comes a time when I do need it .. Good Luck .. Harold W4PQW

> Yes, but this NG is _UK_.r.a

No it isn't! It's rec.r.a.homebrew :-)

But more to the point it's hard to get a stable 20MHz vfo into
a converted CB - I have tried and succeeded only after a lot
of strife. (worked the Spratley Is from the FIAT with that).

It was an old crystal matrix rig and I should have just gone
for one of the lower freq. crystals and mixed up. Live and
learn.

The PTO is more linear, but one has to make a dial anyway
so the end result hardly differs

4395. 6cm waveguide filters - iron screws

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-06 00:00:00 UTC
From: la8ak@online.no
Message-ID: <36424666.18748830@news.online.no>

Hi
Need to retune some 5760MHz waveguide filters - down from 6200MHz. It is a problem to obtain M3 brass screws. Wonder how important it is to use brass screws, or will iron screws work perfectly well? The original filter has three tuned sections and BW is 20MHz. The old screws are too short, need 30-35mm long screws

M12 iron screws seems to work perfectly well for impedance match on my 23cm slotted waveguide antenna

>disassembling these battery packs?

These packs are glued together. Put the pack in the freezer for a while,
then rap it against a table edge. The cold makes the glue brittle, and it
will pop loose with a moderately strong tap when frozen. There's a plastic
tab at the top you need to pry up to get the pack all the way apart (be gentle
with this, you can break it). A bit of glue will put the pack back together
after you replace the old cells.

>to use all the spectrum allocated to the Amateur Service
>.........that must have been the incentive.

But we must ask, what is being incentivized? For the most part it is Morse Code receiving speed. Now we have to ask ourselves if that makes sense today. Is greater and greater Morse speed something on which we should be conditioning access to spectrum normally used for other modes than Morse? What problem does it address? Is there a critical problem with too slow Morse usage on the air? How many notices of apparent liability has the government been forced to issue for too slow Morse usage? As far as I've been able to determine, none.

A license is a government permit to access spectrum, which is a commons, public property, belonging to us all. As such, the government has a responsibility to determine if we are competent to access that spectrum, and is then compelled to grant us access to our property if we are. Thus we have license testing. Now what difference in Morse competence is necessary to use SSB on 14.173 MHz rather than on 14.177 MHz? As far as I can see, none. Yet there is a difference in Morse speed required to gain a permit for using SSB on the one frequency rather than the other. That is illogical, and appears to be an abuse of government regulatory power.

The standard for judging the validity of government competence testing is the necessary and sufficient standard. Government should require as much competence as is necessary, and no more than is sufficient. The Incentive Licensing system fails this test by requiring different standards of competence to grant access to functionally identical spectrum for exactly the same uses. Either the lower level of testing is sufficient or the higher level of testing is necessary. Both can't be true at the same time. That is irrational, and irrational regulation is bad regulation.

If we must have multiple license classes, then the tests should be relevant to the differences in privileges granted. If the privileges are functionally identical,

then different license classes, and different tests, can't be justified. If the privileges granted are different in kind, then differing testing standards can be justified. A rational view of the General, Advanced, and Extra privileges show no difference in kind, so three different classes, and three different testing levels, for access to functionally identical spectrum and identical operating modes can't be justified.

This has always been the fatal flaw of Incentive (to pass faster Morse tests) Licensing. There is no rational and legitimate coupling between the level of competence required and the need for that competence to exercise the bulk of privileges granted.

>am talking about at-home use, and I can not afford a wave solder machine!

What you need is a static hot air source. The Weller Pyropen Jr is a nearly perfect static hot air source for field rework and for hobbyist use. It is relatively inexpensive and easy to use. Just dab a bit of solder paste on each pad with a toothpick, set the part roughly in place with a pair of tweezers, then hit it with the static hot air source. The surface tension of the solder will pull the part into perfect alignment. Now let it cool and you have a perfectly installed part with no fiddling or damage. Simple, easy, quick.

To remove a part, just hit it with the static hot air source and lift it clear with the tweezers. No fuss, no muss.

Hi,

Here you go --

Magnesium -- All metals in this group are anodic.
Aluminium
Duralium
Zinc
Cadmium
Iron
Chromium Iron Alloys
Chromium Nickel Iron Alloys
Soft Solder Tin-Lead Alloys
Tin

Lead
Nickel
Brasses
Bronzes
Nickel Copper Alloys
Copper
Silver Solders
Silver
Gold
Platinum -- All metals in this group are cathodic.

not sure how interesting it is in to note in this thread, it seems that
too many believe diodes have a voltage drop of 0.6V.
I built an MC3356 log detector, it has 0.65V quiescent o/p voltage.
Driving a 100uA meter with a series diode (and resistor), the deflection
does not go down to zero. But using an b-e junction (BC547/2N3904)
improved this very much, transistor base-emitter voltage is much more
definit than simple diodes, "b-e juntion diodes seem to turn on at some
'magic voltage'."
>

>
I read somewhere that Ge-diodes have quadratic characterstique below
100-150mV RF, meaning that if you reduce the RF voltage by a factor of
10, the detected voltage drops by 100 (is it what you say?)

In 1978 LA1TN and I tested forward biassed (15uA) 1N914/1N4148 as
detectors*) up to 500MHz, one diode for detector, the other for
reference. The lower limit RF was -50dBm. The circuit (using 5x uA741)
was rather unstable, it was difficult to avoid temperature drift from
the diodes (very tight temperature coupling is important), and a later
RF mV meter using 2x1N270 had much better detected voltage vs frequency
response over the tested range, 0.010-600MHz

*) believe the diode forward voltage drop was 312-315mV DC

>I falling into the old trap about power being shared between load and
>source, or is there another explanation?

But the diode will try to pump peak volts and we need RMS
for power. At LF that would require a capacitor across the
meter but at VHF+ that's hardly an issue.

So...
power = ((V+0.2)/sqrt(2))squared/R
= (V+0.2)squared/(R*2)

That's my guess....

>filter has three tuned sections and BW is 20MHz. The old screws are too
>short, need 30-35mm long screws

The Q will be affected by the contact resistance of the screw to the inner surface where skin effect becomes important.
The use of metals that are distributed along the valence scale will cause electrochemical corrosion, the tuning may not be stable over a time period. If the filters are to be mounted outside on an antenna for instance iron or iron plated screws will rust. The Q will fall to 0 in time and the insertion loss will increase.

The insertion length for Iron against Brass may be different but you will get a tune.

What ever material you use it is important that the threads should have a good tight fit and that only the absolute minimum of adjustment is done to reduce thread wear. If during a development much adjustment has been made and the screws become easy to adjust then replace them with new ones for the finished item. If you are taping your own holes then use a second tap and do not run the tap right down to the inner wall of the material, this will help to make the contact point at the inner wall an interference fit where skin effect is most important and a higher Q will be preserved.
Plated screws are a plague for this application.

I have a Norcal '38 Special 30m QRP rig for sale.
It is 85 - 90% built. Has an onboard Tick keyer.
Comes with a small aluminum chassis,
all controls and connectors.
Documentation included.

$38 shipped

Hi Jan-martin

I find iron too lossy. Stick to brass. Can probably find some brass
screws here in the UK if you're desperate!

4415. TT 509 Help

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-06 00:00:00 UTC
From: Jim Fielden <fielden@utkux.utcc.utk.edu>
Message-ID: <71uv5v$ll0$1@gaia.ns.utk.edu>
Source record: 77193

Hello All,
I have a TenTec 509, the PTO is 100% shot, TenTec said it wasn't worth fixing, they could get the L11 PTO, but would cost more than the radio was worth.
What I was wondering, could the PTO be replaced with a Var Cap and a coil? I know the radio would work the same, but was just wondering if I could atleast use it for something by making sometype of coil var cap replacement.

Any ideas?

Anybody have an old PTO for a TT 509?

73,
Jim

You can see a variation on what this technique looks like at

http://web2.airmail.net/geets/s2bp.htm

Karl uses a color ink-jet printer to do the paper panel,
and them cover it with a clear plastic film. Then drill
holes through the plastic film for knobs, switches, displays,
etc. Although this is not identical, you will get an
idea of what it would look like incorporating Jerry's
suggestion.

One other comment. The meter scale on a 50 ohm sig gen shows the value of voltage that will be delivered to a 50 ohm resistor. The actual oen-circuit voltage is twice the meter reading. So if the load is greater than 50 ohms the voltage delivered will be somewhere between the meter reading and twice the meter reading. This creates a possible 6 dB discrepancy because we don't really know the input impedance of the rcvr. It can vary quite a bit with frequency and even with the RF gain control. The rcvr is designed to operate from 300 ohms, but that doesn't mean that the rcvr input is 300 ohms.

This is another reason for using the correct generator impedance, 300 ohms, since the factory used a 300 ohm sig gen (presumably) when it wrote the specs.

I would hope no-one is trying to use the rig for 220. If you've ever
looked at the spectral purity of the output on 220 it looks like
an EKG display. Sure you can hit your local 220 repeater - all
of them at the same time.

How do you feel about raised lettering? There is a moldable plastic "clay" which hardens into solid PVC upon
heating in an oven, and it doesn't expand or shrink in the process. One brand is called FIMO, and it's available
in a wide variety of colors. You can build very detailed sculptures etc. out of it. You can also grind it and
paint it after baking.

I've been toying with the idea of making entire (outer) enclosure from FIMO(*), and embossing legends into the
panel, baking it and then filling the letters with a contrasting clay, then baking again. If one did this, one
could obtain really sweet contoured cases very much like the commercial injection molded cases on HTs.

(*) perhaps wrapped around a diecast hammond-type enclosure or home made PC board box?

Or at least, that's my fantasy... I have not actually tried this yet, but I'm pretty sure it can be made to work
very nicely. My plan for doing the embossing is to buy old pieces of type and use them to emboss the logos.
(Haven't found a good source yet -- anyone have any ideas?)

This would obviously not apply directly to your wooden case, but you could make raised letters out of fimo (you
could grind them pretty thin) and glue them to the front.

Other than that, as I'm sure 800 people have suggested, why not use a stencil and a sponge with an appropriate

kind of paint? This, or some sort of dry-transfer label (which IMO is likely to be harder to use) is probably the
most direct way.

good luck and 73,

nick caruso KB1DEJ

Trio TR-7010 has xtal synthesizer, tunes 5kHz 'channels' with vxo to
tune between the 5kHz points (and additional +/-2kHz RIT for RX)

Everything may be worth considering, some friends used ex-CB rig with
70cm transverter for mobile operation
But using VK3YE vxo approach (see Radcom nr 11/98) you might easily have
at least 50kHz coverage per segment, the most important 50kHz segments
for a 2m ssb RX (North Europe) are .030-.080, .250-.300, .300-.350, and
.200-.250

tnx fer interesting arguments. It seems that for indoor applications it
is worth trying iron screws as a surrogate and look for proper brass
screws to be installed later. The problem is that I have to supply some
screws with the parcel when sending the multipliers to USA.
Hope to find a source for reasonable prized brass screws in smaller
quantity in Germany or Scandinavia.

Thanks to all for answers.

My idea was to record all my cw contest activity for further re-playing ,
because of my (poor) ability copying exchange numbers :
I read somewhere about compresion technologies allowing abt. 20MB/hour
recording : enough to have 24 hours (480MB) on HD +ACE-
Maybe any software taking SB input line to +ACo-.mp3 , like CD-grabbers ?

But can't find such software.

I know recording systems for voice logging purposes (at incredibly prices,
hardware crypted, etc.) - not for amateur radio.
I try standard Windows accesories , but it records i +ACo-.wav' so too small
compression - not for me...
So - idea is beautiful that unfeasible ... for this time ...

Thanks to all once again.

I forget if I saw this here, or perhaps in rec.crafts.metalworking, but I saw somebody somewhere suggesting spot welding the tabs on by charging up a capacitor then discharging it through the tab and nicad body. Your mileage may vary, don't try this at home, kids asks your parents first.

: find information on winding them myself?

In addition to Reg's software, you might find the coil program at
www.saratogasoftware.com to be interesting. It's particularly nice
for small coils: if you wind a particular wire gauge following the
threads of standard US bolts (6-32, 1/4-20, etc), it gives the
inductance. It also gives lots of other info about the coils.
(Its results for Q are slightly different from Reg's...I wouldn't
try to guess which is closer to "right", but both programs are
quite useful.)

Power consumption is less for the C part, but also the fan in loading and
fan out current sourcing capability is less for the C parts. In some cases,
replacing a C part with a plain part may load the address bus excessively,
and in some cases replacing a plain part with a C part may not have enough
fan out drive. That's usually not a problem, however. In many cases you
can just directly substitute with no problems.

I'm looking for a manual for a Heathkit IO-105 dual trace oscilloscope.
I've found a disconnected wire inside the unit, and need to find out where
to reconnect it. Thanks for your assistance.

Can anyone recommend web sites for transistor data?

I have a box here for 6 metres, which was an old commercial rig
modified by the father of a friend of mine. I made the unfortunate
mistake of transmitting without an antenna or dummy load, and smoked
the box (and smoke comes out even if I turn it on now and do nothing).
It contains a bunch of uA703s, an LM378, BWF16A, and some BLYnnn devices
which I haven't been able to find data for. Unfortunately none of the
components look damaged which makes things a bit hard.

Hamish

Nice oil filled capacitors, 32 uF at 4500 volts. Mfg by GE, NO PCBs. Perfect for amp pwr supply projects. The caps are 3.5 x 4.5 x 12 inches and weigh 7 pounds each. Picture available via Email upon request. Price is $55 each or $45 each for orders of two or more. Other quantity discounts available. Price does not include shipping. Contact Joe, W4JF at 803-328-2936 or email w4jf@gnes.net.

Rick,

You said the case was a carved wooden case. If it is carved as in the sense of art work it would look nice to use gold wire inlay in walnut or other dark woods.

I am a gun engraver and have done some stock work as well. If you are very skilled with your hands as many carvers are you would be able to pull this off. The technique has been around for centurys and has been applied to European gun stocks many times.

If you really have a classy project and want to finish it off to perfection and think you have the skill I can give you some pointers on how to do it but it would be time consuming on my part!!

Let me know, happy to help a fellow wood and metal worker.

Doug,

I built a tone/voice paging encoder based on the '151. The part you have is good to about 20 Mhz. That is fast enough to do the job. I am interested in a similar idea for two meters and 70 centimeters. There are some very nice radios going to waste because of the cost of cry staling them.

My thought was to modify some of the boards so that an on-frequency sample could be used for the divide chain. That would allow a reference frequency of at least 5 kHz. If others are interested in this we can keep discussion here in the ng. If only a few of us are interested we should move to e-mail.

4445. Re: MRF477 transistor

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-07 00:00:00 UTC
From: John Mortlock <jmort@global.freeserve.co.uk>
Message-ID: <722d28nt1@newsreader2.core.theplanet.net>
Source record: 77154

Motorola seem to have discontinued a lot or all of their plastic
packaged RF power transistors including the MRF477.

The MRF477 now seems to be in short supply and it has been
suggested that some outlets have been re-marking devices as
MRF477 and selling them on. These devices may be capable
of the power output but usually dont have the power gain of the
genuine Motorola MRF477. (15 db)

I've heard that there is a Japanese made TO220 transistor with
characteristics (including Power Gain) very similar to those of the
genuine MRF477.

Does anyone know the number of the device or any idea as to a
suitable replacement for the 477 ??

Spec for the Motorola MRF477 is as follows:

Power out (W) 40
Power in (W) 1.25
GPE (db) min 15 @ 30 MHz
VCC 12.5 V
Device operating frequency range 1.5 MHz to 30 MHz
Package TO220

I'm not sure what kind of circuit you want, but I have seen several. I built a version that was in the Handbook (I think 89, but probably in more than one). I like it because it just uses a few cheap cmos logic chips, so you arent on the hook for any expensive replacement like the defunct Curtis chips. It is a bare bones Iambic keyer, like the curtis, with no message memory and such.

Another thing you might consider is pic chips. I have seen several references to them on the net, so I am sure you could search and find a suitable circuit and source code. This may be why Curtis is defunct, since the pics are so cheap. If you dont have a programmer card, I'm sure someone would burn it for you if you find the code you want.

There may be some other good solutions, these are just things I have noticed while looking for other things.

I do not believe this is correct for the 27xxx vs. 27Cxxx comparison.
You seem to be describing the differences between bipolar (TTL) and
(old) CMOS logic families, such as 74xx vs. 74Cxx. **Note** that
74xx vs. 74HCxx is totally different - see below.

27xx EPROMs are built with NMOS, and 27Cxx are built from (fairly
modern) CMOS. While I've long since given away my NMOS 27xx data
books and therefore can't exactly compare the 27xx to the 27Cxx
parts, I recall that they were spec'ed very similarly, if not
identically, in terms of input/output. I compared the Xicor 2864
to the Xicor 28C64, and they are indeed specified identically for
I/O characteristics (maintain valid TTL levels while sinking 2.1mA,
BTW).

In other words, I believe the 27xx and 27Cxx parts are essentially
identical in terms of replacement.

Note that 74HC logic **may not** directly swap with bipolar 74xx
logic. While 74HC has no problem driving 74xx, bipolar 74xx logic
is *not* specified to reliably drive 74HC, the issue being V(ih)
specification. 74HCT logic is available for 'converting' from TTL
logic level to 74HC levels. Again, the issue is not fan-out or
fan-in, it is that bipolar 74xx logic is not specified to produce
CMOS-logic levels.

another interesting approach for ultrastable VFO on 19MHz is described by K3NZS John H. Baker in QST Aug. 8/80, he built a Clapp-osc but used RG174 cable instead of the coil. His design was made for 35-40MHz, but I see no reasons that it is not possible to move it down to 19MHz, and results may even be improved. For 35MHz the cable length is 5'3", so I would suggest you start with 10ft cable.

I'm looking to build a homebrew CW keyer.
Looks like Curtis (8044 fame) is defunct.
Recommendations of keyer circuits
appreciated. Prefer something other
than a Ramsey or MFJ kit.

Thanks, Hugh VA3TO

I used a relay from an old modem. It is available separately and the
specs are 1Kohm coil and 12V (9V garanteed) - in fact it pulls in
at 7V but there is a 5V version too.

There is a solid state 2 transistor circuit around, too.

Anybody ever opened a probe for Bird model 43? Bought 8 probes for it during the last 20 years, but still some values are missing. They were too expensive, then, but prices are really too high now, believe the local price is sometimes twice the price in UK.
Would like to make my own probes, particularly low power probe (1.3GHz and 2.3GHz 1W), need not be very accurate. Bought a 1W 150-250MHz (150-1) probe as secondhand in Germany, seems it exists some different probes not being offered to everybody.

I did and they wouldn't listen. So I quit! The thinking was so antiquated. The ARRL was just a good ol boys club and had no idea of what lay ahead of them. Now in the recent year they have started to realize if they don't move off their old ways there isn't going to be much of an amatuer population to be king over.

As for running for Kongress! Not in you wildest dream. Expose my life to every thug that wants to pry into it. Good greif! As much as the prying press and oppositionparties will do I don't think the Pope could get elected let alone Jesus Christ himself.

*>decided to sit the test for the Extra Class ticket , you must have
*>had an ...incentive and Hurraah you passed and are now eligible
*>to use all the spectrum allocated to the Amateur Service
*>.........that must have been the incentive.
*
*But we must ask, what is being incentivized? For the most part it is Morse Code

*receiving speed. Now we have to ask ourselves if that makes sense today. Is
*greater and greater Morse speed something on which we should be conditioning
*access to spectrum normally used for other modes than Morse? What problem
*does it address? Is there a critical problem with too slow Morse usage on the
*air? How many notices of apparent liability has the government been forced to
*issue for too slow Morse usage? As far as I've been able to determine, none.
*
*A license is a government permit to access spectrum, which is a commons,
*public property, belonging to us all. As such, the government has a
responsibility
*to determine if we are competent to access that spectrum, and is then compelled

*to grant us access to our property if we are. Thus we have license testing. Now

*what difference in Morse competence is necessary to use SSB on 14.173 MHz
*rather than on 14.177 MHz? As far as I can see, none. Yet there is a difference

*in Morse speed required to gain a permit for using SSB on the one frequency
*rather than the other. That is illogical, and appears to be an abuse of
government
*regulatory power.
*
*The standard for judging the validity of government competence testing
* is the necessary and sufficient standard. Government should require as
*much competence as is necessary, and no more than is sufficient. The
*Incentive Licensing system fails this test by requiring different standards
*of competence to grant access to functionally identical spectrum for exactly
*the same uses. Either the lower level of testing is sufficient or the higher
*level of testing is necessary. Both can't be true at the same time. That is
*irrational, and irrational regulation is bad regulation.
*
*If we must have multiple license classes, then the tests should be relevant to
*the differences in privileges granted. If the privileges are functionally
identical,
*then different license classes, and different tests, can't be justified. If the
privileges
*granted are different in kind, then differing testing standards can be
justified. A
*rational view of the General, Advanced, and Extra privileges show no difference
*in kind, so three different classes, and three different testing levels, for
access
*to functionally identical spectrum and identical operating modes can't be
justified.
*
*This has always been the fatal flaw of Incentive (to pass faster Morse tests)
Licensing.
*There is no rational and legitimate coupling between the level of competence
required
*and the need for that competence to exercise the bulk of privileges granted.

Depending of the cut of the crystal blank the drive required will range from 20
microwatts to about 1 milliwatt. If you are using the old FT crystals or the
HC-6 blanks you will need more drive power to start oscilation than would be the
small watch crystals that need only about 20 microwatts.

I have seen two keyer chips (based on pic microcontrollers) recently.
One is the TICK keyer, used in Norcal's 38 special QRP rig. I think the
chip runs for about $10, and needs a minimal number of external parts.
Another keyer chip that I saw afew years back was made by RAC (radio
adventures corp?) which sold the chip alone, or a whole kit (less case)
for about $25.
Tom.

The question was about EPROMs, 27xxx vs. 27Cxxx, and this answer is
not actually correct. The 'non C' 27xxx parts are not fabricated in TTL,
they're made out of NMOS. Both the NMOS 27xxx and CMOS 27Cxxx EPROMs
are specified to TTL logic levels with the same fan-out, so the noise
margin issue is not really relevant.

The best method that looks very professional is to make up all the art
work for the front panel on the computer with which ever software you
use then take the finished print to your nearest photo/art shop. In the
UK I use a firm called Snappy Snaps. They make, very reasonably priced

water slide transferes of what ever design your imagination can come up with on the computer. I then apply to the front panel and give two light coates of clear varnish. It works for me every time.

Why not try one of the little cable baluns used to convert 75 ohm
coaxial TV cavle to 300 ohm sets? that would probably work.

If you mean the thing that's usually turmed a slug, yep, they're not
too hard to build. All you need is a sample, some 1" aluminum rod,
a lathe and associated tools. Need some circuit board making materials.
Some teflon rod for making spacers. Need some test equipment to
calibrate it.
If you value your time at zero and can borrow the equipment, they
can be fun to build. Won't cost you much more than a new one.
If you just want to make measurements, go buy one.
You can build some stuff that I've never seen available. A directional
pickoff makes an interseting way to inject signal for repeater desense
testing.

>probably requires less power to operate. I have several 27256's in my
>junk box.. I used one last week where a 27C256 was and everything seems
>to work fine? The access speed were both 250ms.. Pete n2mci@ulster.net

The 27Cxxx devices are CMOS Eproms. Most 27XXX Eproms are NMOS.

The NEC 27256 needs 100mA at 5V. The NEC 27C256 needs just 30mA
(Active mode).

Most modern CMOS Eproms have a much lower VPP (programming voltage),
typically about 13V. VPP for the older NMOS chips is usually about 22V.
22V on the VPP pin of a CMOS Eprom is likely to damage the chip.

4483. CTCSS for am and ssb

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-08 00:00:00 UTC
From: Francois Proulx <fproulx@NO!!!SPAMvideotron.ca>
Message-ID: <e9s12.319$4b2.718@weber.videotron.net>
Source record: 77292

Hi,

Even if I'm a ham, the type of radio I use the most is cb for work. I use them to connect my three trucks during snow removing. With the winter coming back, I'm wondering if it's possible to put sub-audible tone to make the radio more private and less disturbing. Does it work with am and ssb or just fm. And finally, where to find info on building it or maybe a kit?

TNX, Francois

HI
I have a Van Gorden Shorty all-band Dipole (G5rv) it came with a
"LONG" pice of 450 ohm ladder-line as a feed line. this ladder-line is
to long for my app. can this ladder-line be CUT OFF to better fit my
app. and if i do will it work as good as it dose now
tnx

Hi, Ed

I looked at your page, and I would like a copy of the pic code. I doubt if the code is very large, so it would probably port very easily to an 8 pin $2 pic like the 508 or 509.

Thanks,
Don

Looking for a pair of 4CX400's. Going to do the conversion on the MLA-2500. State age, condition and price.

Johnny

4489. Small homebrew AM broadcast transmitter

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-09 00:00:00 UTC
From: ishort@pcm.co.za
Message-ID: <726f38$4v2$1@news01.iafrica.com>
Source record: 77057

Hi All

I busy restoring a 1936 Pilot 63 radio. The programming here in South Africa is very limited on Medium Wave, nearly everything is on FM.

I'd like to build a very simple low power AM transmitter with good audio quality.

I'm not good with radio at all, but I did study Electrical Engineering about 10 years ago with no radio specific courses. What I'm trying to say is, I need a fairly well worked out design thats pretty much idiot proof!

All suggestions are welcome.

TIA

Source record: 77058

Re: 2DF4 Directly Heated Pentode.

Hi,

According to the GE Essential Characteristics book -

Pin out -

1. g2
2. internal connection
3. plate
4. filament
5. filament
6. no connection
7. internal connection
8. g1
9. g3, filament center-tap

Vf = 2.5/1.25 @ 0.345/0.69A
Max plate watts = 4.5
Max plate volts = 250
Max screen volts = 125
Max plate watts = 4.5
Cg = 7.5 pF
Cp = 5.5 pF
Cgp = 0.25 pF
gm = 7.5 mA/V

Hope this helps a little.

Cheers - Joe

4491. Re: Help lettering a front panel

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-09 00:00:00 UTC
From: Roland Burgan <rburgan@up.net>
Message-ID: <3646FF6D.DBC5D1D0@up.net>
Source record: 77059

Another way I've used for projects is to make up
the artwork on whatever program you have, and
print it (in reverse) onto a laser transparency sheet.
(I do this with an inkjet printer). Then spray the
printed side over with a colored enamal that you
want for the backround and let dry. Two light coats
recommended. Then go to your local hardware and
get a can of fine droplet glue spray (I use 3M Craft &
Workshop Spray Adhesive), and spray a light coat of
adhesive on the panel and apply the transparancy. The
artwork is protected by the transparent sheet, and will take
a lot of abuse, and is easily cleaned.

Hi all,
I have just updated my webpage, with a simple design for a
interface to allow programming of the GM300 and G300 Motorola
radio's. The design has been tested on a GP300 and GM300/GM350.

For further information have a look on my webpage:

http://ourworld.compuserve.com/homepages/colinlowe

** I can't supply the software sorry **

I just picked up a Bowtie antenna and it doesn't match up to the manual I
have for the HF5B The dimentions are the same(12ft x 6 ft) but it is
missing a few traps.And it is too small for their 10/11 meter bowtie.
Did Butternut make another Bowtie..maybe a 3 Band model???
If so,is there any manual available.I will pay copying and mailing costs.
Thanks in Advance

I have an Iiquid xtal display which on which I have not been successful in obtaining any data. Maybe it is too old, or maybe I have not contacted the right people with Toshiba. Anyway, it's about 4 inches wide and 11 inches long. On the PCB there are two rows of MSM5839GS 48 pin surface mount chips...6 chips in each row. There are also two sets of 4 surface mount chips(14pin) labelled 40H074, 40H393, 40H164 and 40H020. These ICs evidently relate to the two rows of the 5839 chips.Input sockets.....one 3 pin (appears to be DC connection(?) and the other a flat 10 pin male....maybe data(?) It's too nice a display to chuck, but I hate to have something I cannot use, so any help will be most appreciated. Any suggestions on where to look? Thanks. Regards,
George

Try listening early in the morning, perhaps 2am - 5am local time. You just
might get lucky and hear some real DX!

I know from hear (Ohio, USA) I have heard Russian stations around that
time of the morning in November.

Hi all... our tx cooling fan relays are suffering long term contact welding and smoking. The fans are 115vac, fractional HP (1/4 hp or so), the relays are rated for 10A, I used both available contacts, but the contacts are still suffering.

Save from going to a bigger relay, what could I put across the contacts to make them last longer. These relays cycle perhaps 1000/day so limited life MOVs might not be a good solution. Thanks for any tips!

Hugh OM,

Try a 'TICK' keyer chip. Only takes about 3-4 other components to form a complete keyer which operates off of a 3V disc battery. I use mine for my CW mobile work (I glued the TICK ckt onto the bottom of the Bencher paddle base), and it works well for me.

Why not let the fans run all the time? If this is not feasible try a solid state relay. Some of these have zero volts crossing detectors built in and only switch when the AC voltage is at or near zero. A timer circuit that only shuts off the fan after a minimum preset time would lessen the number of on/off cycles. If there are start/run caps involved make sure they are good, bad caps will eat up the relays too.

Interesting that you should mention the cost of homebrew slugs being as much as buying a new one.

I built a 5 watt vhf-fm mobile radio with a T-T mic. It has 5 crystal controlled channels. Some of the younger hams thought it was cool to have a "free" radio and expressed interest in homebrewing for that reason. I pointed out that my "free" radio cost me about 150 bucks... more than the price of a really good used programmable mobile of considerably more power.

The reason to homebrew is to learn more and/or to acquire something that really isn't available by other means. Keep those soldering irons hot. (Showing off your home made gear is fun, too).

A usable slug can be made. It is likely to cost more than buying a new slug and even more likely to be innacurate. It still might be wothwhile building one. I had an article for a similar project around here a long while back. I'll try to track it down, but we better hope somebody else points the way.

I have manuals around here for a couple of Swans. I know I have
the schematics and pinout of the connectors somewhere. I used
to have multiple cables, for both DC (with the chopper module
that bolted on the connector) and for AC. I never managed to
get hold of the 220 supply though. (You can run the 220 supply
on 110, but not the other way around.)

If you can't find the pinout/schematic, let me know and I can either
email one to you or fax it.

You might try

http://www.ultracad.com/calc.htm

Look for

ftp://ftp.eskimo.com/u/u/ultra/notes/pcbtemp.zip

This is a Windows 3.x program that calculates trace width using two
different methods. It has a nice theoretical explanation why the
results are different. Here is a small description:

"PCBTemp.exe, which looks at the relationship between trace
current, geometry, and temperature rise of PCB traces. It looks at
two sources of data (the standard IPC charts, and an additional
set of data from 1968) and makes calculations based on the
relationships shown in those curves. See, also, our associated
article Temperature Rise in PCB Traces."

Doug,
This is certainly doable and I have started this same kind of project a few times in the past but have never completed. One design used a 145151 and an external VCO. I was able to tune receive freqs with DIP switches, but never got around to building the micro to control this for real. There used to be an outfit up in Buffalo NY (GRC I think) that sold a kit using discrete 7400 series ICs. My Father in law built that about 20 years ago and it is still in service.

Please let me know if you are successful. i have a general radio 2M xcvr waiting for me to get back to with this project.

You can get new 4CX400's through Antique Electronic Supply Online!

http://www.tubesandmore.com/ for $140.00 each. I'm not a good judge

of high power tube prices, but that sure sounds like a lot of money.

4523. Need 50 ohm Teflon mini coax

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-10 00:00:00 UTC
From: af389@lafn.ORG
Message-ID: <36485095.4FBBD382@lafn.org>
Source record: 77083

Hi Folks,

A while back, I bought from these newsgroup digests,
some 50 ohm Teflon Coax Cable, very close to same size as RG-174.
I need more but have misplaced the persons name, email address.
I am pretty certain the person was a "Jim" with N2 call letters.

Can you folks possibly help me make contact again with this person?

I need more of this coax.

Thanks for help.

73, W6MIK

Hi,

I'm looking for formulas (or Freeware/Shareware programs) to calculate the inductance of pieces of wire or tracks on a PCB above a non conductive plane.

What Q factor (the order of magnitude will do) can be expected, if a 1 mm diameter silver coated wire (L some 10 nH, UHF frequencies) is used?

I have a 1977 edition of 'Reference Data for Radio Engineers' that I keep
on my desk at work.

Chapter 24 talks about transmission lines, and gives all kinds of formulae.

It may be better to use transmission line theory to solve your problem.

Jim

> What was "incentive licensing"?

Incentive licensing in concept was probably a good idea at the time it was first discussed, but they way it was put into practice created a terrible situation which still has consequences today.

Sometime in the early 1950s, someone proposed that everyone who held a General or higher license be granted all amateur operating priviliges. It was about that time when the Novice and Technician class licenses came into being. The Novice was good for one year and not renewable. It was either up or out after that year. The Technician was designed for technical experimenters and was limited to operating priviliges, I think from 220 Mhz and up, with 50 and 145 Mhz being added later. In order to get the Technician, you had to pass a mail order written test which was the same as the General, and a 5 WPM code test if you were not a Novice and already had credit for it. I think that a Novice and Technician license could be held jointly by the same person if the Novice time limit had not yet expired.

In effect, the General class was the top of the line license as far as operating priviliges were concerned. After 1952, testing for the Class A (Advanced) license was dropped, although existing Class A holders could continue to renew as Class A.
No additional priviliges were granted to Class A operators.

This was the way of the ham radio world for 14 years.

In the late 50s, some deep thinkers somewhere decided that hams were not improving themselves for some reason. They were not changing over to SSB

as fast as they should and these deep thinkers thought it may have been because many of them were too technically ignorant about the then state of the art. In some quarters this was a scandalous situation. There was much discussion of finding a way to force technical competance via the testing and reserved operating privilige process. There was also some concern that many hams were letting their code skills slip because they spent too much time on phone. The appliance operator label was just coming into vogue, and it was thought that valuable design and building skills were being lost. This debate raged in the pages of QST for over 5 years.

The final result was that on a specific date in 1968, anyone who was a licensed General class operator lost a good amount of their operating priviliges on HF. Anyone who held the old Class A (at one time the top license in terms of operating priviliges) also lost a considerable amount, although not as much as the lowley General did. The Extra Class license became the new top of the heap and if you wanted your priviliges back, you had better pass the Extra exams with its 20WPM code requirement.

INHO the largest problems with Incentive Licensing were:

1.- Taking away priviliges that already had been earned. It should have affected new people entering the service, but everyone else should have been grandfathered.

2.- The most talked about reason, technical competance or the lack of regarding SSB had been effectively bypassed by the availability of commercial equipment which actually needed less ability to use than the old AM equipment. By 1968 the
technical argument was moot. Most of us were turning into appliance operators anyway.

3.- It caused a meltdown in the interest of ham radio in the years immediatly after 1968. Take a look at the size of the Cq, and QST magazines of that period.

4.- It was one of many reasons why American ham equipment manufacturers started to go out of business.

I will always believe that Incentive Licensing amounted to a power and privilige grab by a very few people in power at the ARRL who wanted what amounted to a "country club" operating privilige setting for the good ole boys in their circle. For a very long time I thought that the ARRL and the FCC thought that General class and below license holders were held in contempt. I was a memeber of a ham radio club in the late sixties which had a sign saying "ARRL's definition of a real ham...Extra Class License... 2 letter call" It took a long time for me to get over it.

It is interesting to note that the ARRL is doing everything it can to make sure that no one looses operating priviliges with the coming license restructure. I think this stems from bitter past experience.

Hi
Agree that if I only needed one more element, it could be questioned if I better could build it, but I need at least two, and if I find a possible way to make my own element, demand may likely increase, then I might well build 6 or more elements, say 1W elements for 30, 50, 150, 432, 1296, and 2320MHz, need also 10W probe for 1296 and 2320MHz (a friend has got a surplus element which works above 2GHz), and need a 1kW probe for 30 and 150MHz
Some elements may be easy to come by, while 1W elements seem to be rare
Usually the prototype which is worst to make, copies are easier to make, so if anybody out there have some ideas/experience with Model 43 or if you just have opened an element, please tell me what to do to avoid damaging the element to find the secret. At last, it depends who is going to try to make a homebrew element, it may not be so easy for anybody with minor experience in homebrewing UHF/SHF equipment, without proper mechanical tools and measuring instruments.

The return of the all priviliges General license would make the
oldtimers whole, as well a simplifying the license structure as the FCC
requires. The elimination of the Extra Class license would be logical
for simplification, but now another group would be mad for wasting their
time testing, and of course how would we know who to give the status 2
letter calls to?

Well, this really isn't radio homebrew, *but*...

If your dog is running hard after a rabbit, it won't even slow down for
the "invisible fence". Also, it only works when your dog is wearing the
special collar, and the fence is turned on and working.

Finally, it does nothing to keep a neighbor dog from coming into your
yard and beating up your dog, or to keep the neighbor kids (and
lawsuits) out.

These things are interesting, but of very limited practicality IMHO. I
also find homes for retired racing greyhounds, (3,000 to date) and won't
give a dog to someone who does not have a *real* fence.

There used to be a file on those "electronic fences" on the ARRL
mail server. The index be accessed by sending an e-mail to
info@arrl.org (subject does not matter) with the lines
index
quit
(if you want, you can put a line "help" first, if you want to know
about more commands).
I haven't used it for a while, but there was a list of files on
RFI problems, too. Perhaps it helps.

Source record: 77016

You ask "Now what difference in Morse competence is necessary to use SSB on 14.173 MHz rather than on 14.177MHz?" This comment makes no sense to me. Are you trying to confuse the issue or don't you know that the Extra class has exclusive previlages on 14.025 to 14.000? If you ask that same question using the exculsive CW sub band I think the answer is quite clear. 20 wpm is the starting speed in this sub band. Now as to the exclusive phone sub band there is a more difficult written exam. The whole idea of incentive licensing was to give a "carrot" to those who demonstrated greater operator skill (Higher speed cw) and great technical knowledge. I think 97.1(c) states the incentive goal very clearly - "Encouragement and improvement of the Amateur service through rules which provide for advancing skill in both communication and technical phases of the art." Now you can argue that the "stick" of taking away spectrum from the pre 1968 Generals was not good but I think the carrot approach is correct. if we go beyond this and ask is CW really relevent. I suggest you survey the active HF bands and see who really operates what mode. It's one thing to listen to editorials from people who sell equipment or license guides its another to see what are the real facts. I've tuned around myself and made up my own mind. I've also looked at the DX cluster for a more unbiased figure of who really operates what mode. In conclusion CW may be dead or old fashioned on Coast Guard Freqs but is sure as heck is alive and well in the world of Amateur radio. 73 - Jay W0VNE

Below is the latest index of L.O.S.A and you can download the
complete L.O.S.A from the following places...

WWW:

http://www.hth.com/losa.htm

FTP:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

1.0 What is L.O.S.A all about?

This list was started back in -95 when I heard about (more or less)
uniqe problems that was solved by using a BASIC Stamp. Especially
Guy Gustavson's story (see #001) about how he saved his beloved cat
Kesha gave me the inspiration to start writing L.O.S.A. I hope Kesha
still is alive and having a great life. Now 3 years later there are
130+ applications described and I hope you will enjoy reading all
(or parts) of them.

The main purpose of this list is to get an idea of what other people
are using their BASIC Stamps for and maybe get some inspiration or
hints for your own projects. Some of the projects described in the
list also have links to source code and schematics for download.

1.1 How can I contribute to this list ?

If you have done something (big or small) with the BASIC Stamp that
you are willing to tell others please use the form given below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Visit the following Web site and fill in the contribution form...

http://www.hth.com/losa.htm

1.2 List of contributions

Guess they don't have these in G4 land! They are also called invisible fences.

It is a wire buried around the boundaries of your property, a few feet inside the property line.

Your dog wears a collar that has a small radio receiver. There is a signal going through the buried wire.

When your dog approaches the wire he receives an electric shock from the collar, and soon learns where the boundary is.

It is very effective at confining your dog without having to put up what some people consider as an ugly fence, which is also more expensive than the invisible fence.

Jim

If I remember right, the one I used at my last house was pretty low,
around 30 kHz or so? They want the wavelength to be significantly
longer than the antenna, so as to not create virtual "holes" in the
radiation pattern through which your Orwellian-afflicted pooch can
escape. :-)

look around 27.145 FM. I have a training collar from Inotek on that
frequency.
The plan is to shock the dog into obeying the border set up by the "fence".

>letter calls to?

Simple:
The FCC mandates all U.S. amateur licenses to expire at
11:59 p.m., UTC, December 31, 1999.

The FCC mandates all current amateur radio licensees must
re-test prior to that date and time in order to be licensed
at the level of examination for which they pass all the
required components. Prior license level irrelevant and be
damned; no "grandfathering," no "good ol' boy" actions
permitted.

A 90-day grace period, beginning 0:00 a.m., UTC, January 1,
2000, will allow "last-minute exam-takers" to continue
operating while their examination results and applications
are processed.

Those current licensees who do not re-test, or who the FCC
says are not yet certified as licensed by the end of the
90-day grace period, must cease operating until such time
that they re-test and are officially certified by the FCC as
licensed.

Piece of cake.

Everybody wins: Equal opportunity testing; trying out the
new licensing standards (whatever they come to be); more
stuff for the VECs, ARRL, Fred, et al, to do.

Now *everybody* can whine ... ;0)

4561. Experiments w/ low cost MOSFETS as RF pwr amps

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-11 00:00:00 UTC
From: l2jarvis@mindspring.com
Message-ID: <364a061a.762268@news.mindspring.com>
Source record: 77026

Hello,

I recently ran across a circuit for a 15W linear (class A/AB) RF amplifier
using a pair of IRF511's. The accompanying article stated that efficiency
began to drop off above 10MHz, and was very poor at 14MHz.

I decided to investigate, and see if another low cost switching MOSFET

could be found that would function more suitably at the higher end of the
HF spectrum (14-28MHz).

Three devices look promising. These MOSFET's have low Rds, adequate
dissipation ratings, are available for just $2 or $3, and are available in
TO-220 packaging.

Device Vds Rds(ohms) Pd (watts)

MTP3055V 60 .15 40
IRFZ34 60 .05 88
IRFZ44 60 .028 150

Has anybody used these MOSFETs in the upper HF range? Care to share your
experiences? If anyone is interested in the results of my experimentation,
send me an email and I'll try to keep you posted.

Thanks and 73
Lee Jarvis - KN4VN

I don't know of a good source (except perhaps the paint you can buy at auto stores to repair rear-window defroster conductors), but I'll be interested in hearing how it works out. I wouldn't expect paint applied to contact surfaces to last long at all because of the switch's wiping action. But maybe you're planning on applying it to some other part of the switch assembly?

I've found that one of the most important parameters is gate-drain capacitance (and to a lesser extent the gate-source C). In general, devices with lower on resistance have larger area, and therefore greater capacitance. Even if the final stage efficiency can be made good, it takes a lot of drive power to charge and discharge the capacitance, so overall efficiency can be poor due to drive power requirements. It might be a better trade to accept a bit greater on resistance if it brings lower C. Increasing the drain voltage should help because it should decrease the power lost in the on resistance, due to the lower drain current.

I'll be interested in seeing the results of your experiments. I'm sure that a number of others will be, too, so hope you'll post them here.

4566. Re: Experiments w/ low cost MOSFETS as RF pwr amps

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-11 00:00:00 UTC
From: Pieter Ibelings <nntp@ibelings.com>
Message-ID: <72d6d3tdb1@camel21.mindspring.com>
Source record: 77031

The only articles that I've been able to find are:

500 Watt HF at:
www.picks.force9.co.uk/throb.htm

1000 Watt CB amplifier at: (Breaker 19 for radio check!)
http://www.advancedpower.com/TechSupp/App_Notes/APT9701/Description.html

250 Watt 6 meter amplifier at:
http://www.advancedpower.com/TechSupp/App_Notes/APT9702/Description.html

And on the other side of the coin, using $500 FET's check out my page at:
http://www.ibelings.com/n4ip/mrf157.html

In this news thread Roy Lewallen commented:

>I don't know of a good source (except perhaps the paint you can buy at
>auto stores to repair rear-window defroster conductors)
>
Went today and got a Loctite defroster stripe repair kit and it works
fine. The Kenwood switches in the TS-530s are tinned copper contacts
riveted to a copper trace on circuit board. The copper/tinplate seems
to loose contact without current flow. The paint seems to work fine
but it is a bear to put on the lower contacts..... 73 de Eddie,

Self inductance of a straight wire.
At radio frequencies, the self inductance of a straight round wire =

L = 0.0021 (2.303 log10 4len /dia -1) microHenries
Where len = length in cm dia = dia. in cm

From the VHF UHF MANUAL fourth edition, RSGB.

My 'Reference Data for Radio Engineers' (1977 ed.) describes Teflon
as being excellent for moisture, fungus, and abrasion resistance. It
does not mention UV, which is what the problem is, but I beleive that
it is also excellent in that respect.

: *Zero dbm. = 1 milliwatt. This shouldn't cause any problems to a crystal.
: *(dbm means "in reference to one milliwatt").
: *
: *However if you are concerned you could isolate the crystal with say a
: *10db loss pad this will reduce the power applied to the crystal to less
: *than one-eighth of a milliwatt. Or, reduce the output of the test
: *oscillator/generator. Watch your impedances1
: *
: *Note: every 3 db.reductiom = half the power.
: *
: *Regards. Terry S. Torbay, Newfoundland, Canada.
: **********

: Depending of the cut of the crystal blank the drive required will range from 20
: microwatts to about 1 milliwatt. If you are using the old FT crystals or the
: HC-6 blanks you will need more drive power to start oscilation than would be the
: small watch crystals that need only about 20 microwatts.

One thing to be careful about: in the crystal model, there's a series
R-L-C, shunted by the holder capacitance. Be careful to not let that R
dissipate too much power! You can get even a large and relatively inactive
crystal to oscillate at very low power, but if you apply a signal
(either from a test oscillator, or by self-oscillation in a circuit) that
causes too much power dissipation in the crystal itself, the crystal will
die a hard death. I learned that while testing watch crystals. Suggest
you don't try to excite the series resonance with a voltage source...

Source record: 76862

Just a head's-up on the Advanced Power Technologies RF MOSFETs...
they're available from Richardson Electronics in small quantities,
in the $30 to $40 range for "book" pricing. A larger buy, or with
schmoozing properly applied, will lower those prices.

Email me if there's interest, and we can get a group buy together
and maybe save some bucks (at least on shipping&handling).

Now here's MY request -- does anybody have a reliable, cheap source
for copper heatsink spreader plates? RF Parts has 'em but prices them
out like solid gold.

Puget Sound (and the Willamette valley, where I live) aren't a good test at all. I got away with using polypropylene guy rope for several years. A friend in Denver (where they have a lot more sun AND a lot more UV) had a polypropylene-guyed mast fall down after six months. He could break the rope with his hands.

Hi John,

I have been using this big linear power supply for initial tests. There have
been horror stories of rf getting into switching power supplies and making
the voltage jump to 100V and ruining the FETS. After I got the amp working
on the linear supply, I've tried it with a lambda 1KW supply and I get about
400 watts on all the bands. This amplifier is efficient only at it's full
limit. I am currently looking for a switcher that can handle 2.8KW out (DC)

Ham Radio Today magazine published a series of articles about converting CB rigs to 6M, several years ago. Sorry, I have lost my copies, long ago. Perhaps some of the UK amateurs can help.

There were several variants of the 148. The 148GTL DX, with the Motorola MC145106 PLL, is probably the easiest one to convert. You will need to modify the VCO, RX and TX band pass filters, Driver and PA matching networks, and output Low Pass Filter.

Good luck with the project.

I wasn't planning to go to look at the
ambulances!

You should come back this weekend, there is a big
hamfest at the Colliseum.

It is a 2-day one and I usually meet up with
Sonny Day, Backstabber, Bluegill, and Mr. Muscles
(The guy who builds the Muscle Beams) there....

You can build a Buck converter. The design is real simple if you use the right power module and part layout. I have used a Buck converter running directly off a 480 VAC 3 phase line to supply up to 300VDC regulated at 200 Amps for a line of RF inverters (200Khz and rated for 45KW of output in induction heating applications) manufactured by the company I work for. The Buck converters have worked solidly for some years now with no problems what so ever.

You can check out this URL for a start. These are Buck converter power blocks which are about the right current rating for what you will need to build a switch mode P/S.

4594. Capacitor Replacement??

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-12 00:00:00 UTC
From: djkc6ssf@sonic.net
Message-ID: <djkc6ssf-1211982257030001@d124.nas21.sonic.net>
Source record: 76874
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors

I have an old multi-voltage power supply for a tube set and I blew it! It converts 120VAC to 6v, 250V and 400V.

One of the electrolytic Capacitors blew its top. But it is a strange beast with three leads; two on the plus end and one at the Neg. end. About 1 inch Dia. and 2 inches long, dull orange color, Great that the label fits so much writing.

Item is:
Solar Minicap Dry Electrolytic Capacitor
Cat. No. M2x8-450
8+8 MFD
450 W.V.
528 V.S.P.

It appears to be a "tubular multiple section" cap, based on my 1963 ARRL handbook.

So, can I replace this with two modern 8 MFD at 450 V electrolytic caps?? Would this be a DC or AC rating? does it matter

Thanks: David Jackson, KC6SSF

The usual ad is that the animal receives a "harmless correction" -- I'd
hate to receive one of those "corrections"...

I've heard that some dogs are smarter than others, run thru the "fence"
and play on the other side.

The standard comm-spec boards should work...
BUT.....
1.you would need the more costly combined encode/decode version.
2.you would have to figure out how to interface the board to the radio.
3.I think that SSB would NOT work-even the SLIGHTEST tuning error would
change the CTCSS tone, thus it would not be reconized by the other unit.
AM should work ok though, assuming #2 is done properly.

Ugh. Tin-plated contacts. They'll always fail after a while if there isn't a considerable amount of current involved. Tin is soft. Like aluminum, it oxidizes almost immediately on contact with air and, like aluminum, its oxide is hard and non-porous. So you quickly get a thin layer of very hard tin oxide on the surface. When the contacts make, they shatter the tin oxide and force the fragments into the soft tin underneath. When the contacts break (or jiggle), fresh tin is exposed which oxidizes. The new oxide layer is smashed and the fragments embedded the next time contact is made, and so forth. After a while, the contact surface looks like a battleground, with shards of relatively non-conductive tin oxide sticking out all over the place, and no non-oxidized tin to be found anywhere near the surface. I once saw a photomicrograph which showed this very clearly.

The only contact material I've ever seen that will last for a long time in "dry-contact" (low current) conditions is gold. Period. Tin will always eventually fail.

I'll be interested to see how long the coating you put on the contacts will last. I'm afraid that the top layer of tin oxide, which you coated, will shatter and become embedded in the tin just like previous layers, resulting in failure again before long.

Well ... this may be water over the bridge now, but when I had the same problem, I talked with a techie from Loctite, a mfr. of the defroster stuff. He didn't recommend it for the same reason mentioned by Roy.

I got some stuff made by CW (Circuit Works) from Mouser. It has silver in it and for that reason, is expensive, but does work. I used a toothpick for applying it. I figured that it was a one shot thing so wanted to give it my best shot. This stuff is even solderable at low temperatures. Model number of the conductive pen is CW2200MTP, and think it was around $35 shipped. Literature says the uses are for drawing highly conductive silver traces, jumper and shielding with precision and control; quickly creates conductive silver traces on most surfaces.

73 Dwight W9YQ

So I ended up buying

Item 3 is even more true than you realize. Most SSB transmitters cut
off all frequencies below 300 Hz.

Get in touch with KD1JV. He's making a DDS package that marries to a CB set to make a 10 meter only, VFO controlled transceiver. I don't know any more details than that but he can elaborate.

You can contact ST Microwave, formerly Eaton Microwave
at 955-975 Benecia Avenue, Sunnyvale, California 94806
Phone 408-730-6300. The part number you listed belongs to them.
The part goes in an Argosystems, Inc. unit. Their part number is
102993-01. They are also in
Sunnyvale, phone 408-524-2031.

It is listed with a National Stock Number of
5865-00-510-3794.

Frequency 10.7-18.0 GHz. It is supposed to come with
its own driver.

Hope this helps.

Great post!
My own experience has demonstrated the EE vs Technician relationship in

exactly the way you describe. I am a Technician, having worked in communications for about 15 years now, and at my last job I worked with a guy who was a relatively new EE with a few years as a technician under his belt as well. Most of my knowledge is emperical, learned from being strapped to the bench over the years, while most of his was "book smarts." The combination of the two was great, we were very productive, and we learned a great deal from each other as well. Unfortunately, economic matters split up the team; no one with an EE will be satisfied with technicians wages for long, and with the demand for RF techs increasing, I also moved to greener pastures.
When it comes to amateur radio, homebrewing can combine the two. As one progresses from simple weekend projects to more advanced projects, and then on to building from one's own designs, one develops the theroetical base of the engineer combined with the practical knowlege of the technician. Sure, it's no substitute for years of school or professional experience, but it's a great supplement to it. For me, it's a fun and rewarding pastime that all hams should be encouraged to at least try.
73,
Steve K8VO

>Subject: MICOR Mobile Repeater
>Anybody out there put one o these on the ham band?
>Anybody tune one of these duplexers down from 463/468 to 443/448?

A friend put one down in the 443/447 range without problems, made a standalone repeater by adding a CS ID-8. He did not do any component swapping except for the XTAL to put it on the freq he wanted. Got it close to original specs for sens and power. The unit got passed on to me when he became a Silent Key earlier in the year.

I put one at 439.600 simplex useing one of the original xtals and swapping the IF mix .

good luck.

4611. NT support for microcontrollers programming?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-12 00:00:00 UTC
From: peter nelson <pnelson@ultranet.com>
Message-ID: <72f5as$a50$1@strato.ultra.net>
Source record: 77053
Cross-posted to: comp.realtime,sci.electronics.misc,rec.radio.amateur.homebrew

I've been an electronics hobbyist for 25 years
and most of my projects have involved extensive
hard-wired SSI or MSI logic (74LSxx, 74HC,
4000-series, etc). After my latest project (for a
digitally-programmable delay electronic flash
controller) saw the usual parts-count explosion
I've decided to advance my skills by a quarter-
century and start using programmable micro-
controllers.

Many people have suggested the PIC series
by Microchip, but neither they nor any of the third-
parties I called make programmers that run in
NT!! Just Win95 and DOS. (So NOW who's
behind the times, technologically?!)

Are Intel or Moto any better? Both at work and
at home I run an all-NT shop. What's a minimum
setup I need to start experimenting with this technology?

Thanks in advance!!

---peter (N1CHJ)

Would it be possible to create a narrow-band design using a shunt
gate-drain inductor to resonate out the gate-drain capacitance? I
suspect that the same thing could be done for the drain-source
capacitance.

I use a freeware program on NT for parallel port programming of 16F84's. Have a look at David Tait's PIC pages (sorry URL not to hand). The rest of the Microchip runs on NT ok, though the simulator has certain performance problems.

Personally, I blame Bill Gates for Windows 95.

There are several problems with this approach. The first is that the capacitance is very large, so a very small L would be required. This results in an extremely high Q circuit. The second problem is aggravated by the first -- the C varies over about a 2:1 range during the cycle (more or less, depending on the device, the drain voltage, and the drain voltage swing), so the circuit would be resonant only during part of the cycle. The third thing I'd worry about is stability, as the magnitude and phase shift of the fed back signal vary over the cycle and with small frequency changes.

The Q could, of course, be lowered at the expense of power dissipation in the network by adding a resistor. And even partial cancellation of the C would help things, so it's not altogether a bad idea. But I don't think you'd be able to really unilateralize the component this way. I haven't tried this approach myself, so don't have any practical knowledge of how it might work. Maybe someone else out there has tried it.

Source record: 76876

Hello, I have the following Amateur radio tubes for sale. All are NOS
in the original box unless stated otherwise. When possible, (some tubes
can only be tested in curcuit) tubes are tested with a Hickok TV-7D/U.
I have a vast amount of tested, miniature tubes for your recievers,
transmitters, test equipment, etc. at very reasonable prices. Also have
a pretty huge stock of all types of NOS tubes, please inquire about things
not appearing on any of my posts. I'm in the midst of learning how to
set up a website, perhaps in this life :o)... Shipping extra, runs only
3.00 and up, whatever the post office charges...insurance is only a buck
or so, depending on the market value for the particular item(s).
The large transmitter tubes have been checked via ohmmeter.
I will only shipped these fully insured.
Of course, i'll guarantee them to work properly, so PLEASE TEST CAREFULLY
IMMEDIATELY apon arrival, and if it doesn't do what you like, just send it
back right away for a prompt refund,(in original,shipped condition) less return

shipping charges. If defective, I'll absorb initial shipping costs.
Thanks,
if interested, drop me a line... 73's
Joe Pratt, Tubecntral@aol.com

i really dont know of any manufacturers of kits, but you could get a (low cost/ cheap) rig from a place called Coppers Electronics, it is a CB store out of KY, but they carry a lot of 10M gear....check out Coppers.com, i think.....

Terry Sanford writes;

I'm also looking for a low power AM (TX) transmitter to broadcast on, say, 1.5 megahertz. (Probably 100 milliwatts would be plenty, but read on.)

Each year we have church services at the main cemetery in this town, in memory of our dead. A couple of weeks later another denomination does the same; we often attend each others service so my transmitter concept would gladly be loaned to both churches as required and other parishes might also be interested?

We have another cemetery about 2-3 kilometres away, which is where my late wife is buried; it is customary for relatives to be near their family gravesite during the memorial service. We presently attend the service at the main site but would love to be near her grave and be able hear the service at the main cemetery. As time goes by this second site will become more and more used. Land lines are not available or would be a prohibive cost for once a year use.

At present a retired CBC (Canadian Broadcasting Corp.) Tech. sets up loudspeakers through which the officiating minister/priest/cleric etc. and anyone reading scripture etc. 'broadcast'. As years go by our population ages and we notice that some older people attend but remain in their cars. There is no parking within the cemetery grounds. Also the cemeteries are adjacent to a main road and the noise levels are high. The result is that the loudspeakers are not fully effective at the main cemetery and are not extended to the other site.

Most cars here are eqipped with AM/FM radios. Also most families have at least one person (usually a teenager!) who has a portable radio, and, most families have a radio normally operated by AC that can also operate from batteries. There are no local AM stations above 1.2 mhz. and the cemetery broadcast is always early on a summer evening. Night skip interference should not be a concern and there is quite a bit of broadast band between 1.2 and 1.7 for a low power TX. (We intend to check with the Canadian radio licensing authorities before operating and

to ascertain antenna requirements/limits).

The CBC tech and I have discussed. We expect to retain the speakers and encourage use of the TX broadcasting to portable/car radios for people within the main cemetery who are furthest away or in their cars adjacent.

The reqirement appears to be a very simple, stable TX, probably powered from 12 volts (thats what the CBC tech uses now for his speaker amp.) with probably a low impedance input; a tap off the speaker output of the existing 4-8 ohm. loudspeaker circuit, with level adjustment, for example. It would be operated for a period of time before the cemetery service so people could "tune in" and for duration of the service.

Initially we would not expect to transmit to the other cemetery site; what sparked this idea was the present difficulty of following the proceedings due to noise, traffic etc. at the main cemetery.

However one possibility would be to transmit the proceedings by cell phone (about 40 minutes 'on air' time) to the other site (quality?) and 'broadcast' that over a loudspeaker or a second, very low power, TX, since it is a smaller area.

Suggestions/comments/source of circuit etc. welcomed.

Regards Terry S. Torbay, Newfoundland , Canada.

>
SUGGESTIONS:
Get rid of relays, run fans continously.....
1/4 HP at 115 volts is about 170 watts or so, or less than 2 amps; once the fans are running and not allowing for any current phase angle. Starting current to get the fans moving from standing still will be high and you have an inductive circuit, which induces contact spark-over whenever contacts open. 'Spark Quench (Suppression)' resistor-capacitors across each contact might help to reduce contact arcing/burning. Mercury relay contacts could be an alternative.
There must be quite a 'power surge' each time a fan starts? Is/Are there any other items in the motor circuit such as starting windings so that initially (each time the fan motor starts) there is a much higher current which then drops to normal running current? Is your 115v supply at correct voltage? Is the wiring to the fan motors of proper size, if too small there could be voltage drops, especially when starting? I've had motors that cause the house lights to "blink", every time they start. (Even something as small as domestic frig.!) especially if the 'hydro' was low. (By the way my lights just blinked, it's 02:00 hours here; they must be putting the provincial grid to bed!).
If your fans go on/off 1000 times a day (wow, that's roughly 40 times an hour!!! or every 1.5 minutes???) maybe they should run continously? Also do all the fans have to be on/off or could some run continously and only some on thermostatically controlled relays?

Sounds interesting. Please post info. when you get it resolved. Good luck.

Hi David,

Your capacitor is simply a two-in-one so you can replace it by two separate capacitors. The voltage rating is for DC, as an electrolytic capacitor would be destroyed by AC (this applies to the usual type).

73's de N5APG - Jim

I installed one of those fences. I was blowing fuses in the

transmitter unit when I transmitted 500 watts or more on 75m. I

called the company and they couldn't figure out why. The fuse

that was being blown had a resistor built right inside with the

fusible link. I replaced it with a standard 1/2 amp slo blow fuse

and the problem went away. I figured that the fuse was acting as

an R/C time constant and/or resonant near the freq I was xmitting

on and with the 1000' of wire (the invisible fence itself) directly

under my 75m dipole, picked up enough RF to fry it when I keyed the

Xmitter for a while (the fuse didn't always blow unless I was using

the rig for an extended period by talking for long periods).
Anyway, to get back on subject, when I was talking to an engineer
with Radio Fence, he told me that it operated at 10.65 kHz using
"digital pulses". The digital pulses allowed the receiver in the
dog's collar to properly receive and decode the CORRECT SIGNAL and
NOT just NOISE, say from lightning. I was esp. interested in this
as I was afraid I might "fry my dog" everytime I transmitted a fairly
strong signal when using my ham rig esp. with amp on. The Quality
Engineer - Phillip Greene also told me that the collar puts out
6,000 volts but is current limited to 3 microamps. Even so, my dog
will sometimes make a run full steam and quickly pass thru the fence.
She gets a dose of shock but not for long if she's fast enough. When
I crank the power up on the fence, the radiation pattern widdens
around the fence so she would have to substain the shock for say a
length of 12+ feet instead of 3 - 6 feet on either side of the fence.
This is certainly a deterent to her planned escapes !!
Since dogs generally have a lot of hair around their neck, they
are not generally in GREAT contact with the two electrodes protruding
from the collar unless the collar is made to be VERY tight around
their neck. Therefore, I don't think they would normally get the
type of HV that a person might get if they wore the same collar
around their neck and on bare skin. I haven't tried it myself, so
its only an educated guess. I did let myself get shocked while
holding the collar in my hand. It's a pretty good "correction"
but NOT the 50KV to 150KV that might come from a "stun gun" !!
The fence is a great investment at around $100 (I think) and
you can get more info from Radio Fence directly at:

wrote:

: There are several problems with this approach. The first is that the
: capacitance is very large, so a very small L would be required. This
: results in an extremely high Q circuit. The second problem is
: aggravated by the first -- the C varies over about a 2:1 range during
: the cycle (more or less, depending on the device, the drain voltage,
: and the drain voltage swing), so the circuit would be resonant only
: during part of the cycle.

Sounds like an ideal device for varactor doubler or tripler
applications :-)

: The third thing I'd worry about is
: stability, as the magnitude and phase shift of the fed back signal
: vary over the cycle and with small frequency changes.

How about a common gate configuration ?

This would eliminate the problem with the variable feed back
capacitance. The impedance levels would be quite low, so you would
need to dissipate some power in resistors in order to get the Q to a
more reasonable level in a resonated design.

Could some design ideas from common grid triode power amplifiers be
applied to grounded gate MOSFET amplifiers ?

Yes, you can replace it with two single-section caps. You want DC capacitors - AC caps are used for AC applications like phase shifting reversible AC motors, are NP (non-polarized) and are more expensive.

Note: If this cap went bad, there may be others about ready to do the same because of age. You may want to "recap" the whole supply.

Hi,

We are doing some filming underwater.
For the sound part I use an OTS (Aquacom SSB100)
Normally this works fine.
This time we're going LIVE, so the director asked me if it
is possible to have contact with the diver trough his
tv-intercom system.
I tried to make the connection. But I still need to switch
it manually between send and receive.
There is a vox on the OTS but it is only activated after I'd

already switched to receive.
So the plug has 6 pins:
A + B = line/speaker out
C + D = Mic in
E + F = connected / short circuited (= my extra switch)
so, if E & F is not sc. I receive the diver (he has a PTT
system)
but it is impossible to transmit without E&F sc!
if I connect E & F together, I can send my signal trough the

mic in (C+D)
The vox is than activated (stops signal below -10dB)
Is there a way to connect these thing so that the vox does
the switching???

If you can help me, please reply asap; we're shooting on
sunday.
Thanks,

--

Guess we dont need them over here......

Using electric shocks to get your dog to stay in your garden can be
really cruel! What happens if the dog gets thru? Then you have a dog
that *NEVER* will enter the garden again!

Or if my ham-transmitter start to activate the collar, that for sure
would drive the dog nuts....

I can only see one useful usage of the electric collars, that is when
trying to correct when the dog starts to chase rabbits and/or other
wild animals. But this must be made under supervision by a experienced
trainer in a controlled environment.

There are a lot to say about elecric collars but I guess it is better
to have that debate in the proper newsgroup.

Cheers

When moding the T8 DO NOT attempt to use it on 220....
the 220 TX is SPURIOUS like a Christmas tree and it WILL blow the
6mtr TR switch.......it WILL void your warranty.....
The problem is the PA brick is NOT made for 220 but 2mtrs...and
cannot handle the 220 signal......folks, DONT DO THIS!!!!!
EVEN if it works and doesnt blow your 6mtr side, you WILL make
some 220 ops very POed (by keying more than one rptr!) and the
antenna is NOT resonate on 220 anyway...not to mention it IS illegal
under Part 97 emission rules...

Get a COMET diplexer and then run a 1/4wave on each band!
That way you have two antennas and instant bandswitching! :)

Not necessarily. For example, the popular Needham's programmers (and probably others) interface to the PC via the parallel port. Win95 applications can access parallel port I/O registers directly, which is a definite no-no in the WinNT environment. NT apps accessing the parallel port are required to do so through a device driver.

Message-ID: <01be0f10$9909c400$25f377ce@dfsfs>
Source record: 76896

I'm not a ham, but if anybody can answer this question, you gentlemen can.

I'm using software to decode RTTY, CW etc. from my shortwave receiver.
But I'm getting a lot of interference from the computer through the audio
line. I have built a filter using a 600 ohm audio isolation transformer.
I haven't used it yet but in testing the connections I noticed that it
seems to cut the volume down severely. (The test involved listening to the
radio through a earphone, with and without the filter) Is this normal or
have I not
made the right connections?? (I have already tried RF chokes for this
signal problem and they were useless. Good for reducing wall-wart
interference, tho)

4637. Max DC Voltage RG-213 coax

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-13 00:00:00 UTC
From: Frank Dinger <frank.dinger@zetnet.co.uk>
Message-ID: <19981113142933704 32@zetnet.co.uk>
Source record: 76898

It probably has been discussed before on this NG ; for the HV power supply 3000-3500 V of an RF power amp . with a separate HV PSU , I am considering using RG-213 coax between the PSU and the RF deck (anticipated length 600mm or abt 16 inches)
In a list in the RSGB -VHF Manual 4th edition ,the max operating voltage for this type of coax is 5000V (rms).
This figure suggests that a Vpeak of 1.4x5000= 7000V would be tolerated. Or is it necessary to de-rate for DC use , and if so , what would be the upper limit.

I can imagine that PL259/SO239 and N-connectors can't handle 3500 V-DC . If that is the case which non-exotic (co-axial ?) types of connector could be used with RG-213 coax..

TIA for advice

The key idea is to train the dog properly, in accordance with the manufacturer's instructions, to avoid the fence boundary. If you do this, the dog won't be shocked more than once or twice before learning the limits of the fence boundary. The collar sounds a warning beep long before the shock occurs, and the idea is to train the dog to avoid triggering the warning beep. The shock is only delivered as a last resort in practice.

That being said, I think the best use of the invisible fences is as an adjunct to a conventional fence, to prevent digging! Run the wire around the base of the fence at a very low power level, such that the collar only activates from a few inches away. After the first couple of "corrections" are delivered, you can take the collar(s) off the dog(s) altogether -- they will have been cured of digging under the fence!

I would not, personally, rely solely on a radio fence to keep your dog from running out into traffic, no matter how carefully trained.

4640. Replacement Transistor

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-13 00:00:00 UTC
From: af389@lafn.ORG
Message-ID: <364C4318.15279238@lafn.org>
Source record: 76901

Hi ,
Need help finding a replacement for a RF transistor marked
"CD3276"
I suspect the specs to be on the order of 300mw in for about 3W out at
470Mhz. the mechanical diameter is approx 1/4" and it has a screw stud
protruding into the heatsink.

Is in a HUGE OLD 70 Watt 450 MHZ mobile radio.

Thanks for help.

4641. EMI probe-HomeBrew

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-13 00:00:00 UTC
From: af389@lafn.ORG
Message-ID: <364C4DE4.AAFADA19@lafn.org>
Source record: 76902

Hi,

A friend and I are trying to revive a SICK 450 MHZ 70watt
Mobile radio with 10 WATT output. Thru voltage probes, have located
a exciter transistor that won't peak. Marked "CD3276" vendor
unknown, guessing 300mW in 3 W out 1/4 stud. We need confirmation
by another method that this transistor is bad.
Trouble could be earlier in multipliers.

I am looking for a homebrew method of sampling current
(HF THRU 450 mhz) in RF transistors and surrounding parts
that are installed in PCBoard. Soldering in a TEMPORARY
current sense resistor, wire or core OFTEN IS NOT POSSIBLE
without causing detuning of it's own.
Want to avoid doing major surgery on PCBoard.
Perhaps an EMI probe, not sure? Want RELATIVE measurements.
Want to build it myself.

Voltage probing shunt base resistors and shunt collector
resistors is not conclusive regarding USEFUL POWER DELIVERED
from an exciter transistor.

Thanks for any suggestions, hints, comments.

I think the original post was about frequency of the "fence" transmitter.
I thought the fence could be in the 27 mhz area as my training collar is.
Sorry about getting off track., but the thought of that trainer(she hates the
collars) tring
the collar still makes me shake my head ,as I have seem what they do.
there is a neon bulb for testing the collar's output.It fires the lamp at level one.

Mike AA7QA
ps they are hard on the dog ,but some thing need a little help at a distance.
my Brittiany like to nip and scolding the dog after the "exchange" has not helped.
the collar gets the point across as he does the nipping and he is getting better.

I'm trying to build a digital display for my TS-520. I'd like to keep things the same as the DG-5 kit that Kenwood sold. I'm looking for info on the actual pick off points in the rig, including where the 3 signal and the 12vdc output were recommended to "appear" on the rear apron of the radio. This info (maybe hardware???) came from Kenwood in the DK-5 adapter, I think, and outlined the steps necessary for conversion to the DG-5 readout. I'll pay for photocopy or good info on the steps that Kenwood put onut in the DK-5 kit. Thank you. 73 de -- VE6INM (Glenn)

From: ve6inm@my-dejanews.com
Message-ID: <72id9f$73$1@nnrp1.dejanews.com>
Source record: 76962

Hmmm....my thoughts would be that the transformer is loading the audio output of the receiver. 600 ohm is unusual for the modern solid state receivers, and that could account for the audio level being reduced. As to the interference, I would look to the PC much sooner than the radio. There has been much documented about the RFI generated by the PC, and how to go about shielding it to prevent the noise from getting into the radio. While I am too old and ignorant about computers to tell you how to fix it, I think I would spend my time looking at the PC and not about the audio line from the radio. But I'm sure some of the other fellas on this news group can give you some good tips. 73 de VE6INM (Glenn)

Do you have a copy of the ARRLs "W1FB's Design Notebook"? That
has copies of some older QST articles on building crystal
filters (W7ZOI was the author). It's worth a read if you
are considering building them. I plan to build a couple
of them using the method described (as soon as I shovel
off some bench space).

Source record: 76967

I have been wondering why I have never seen a BPF design on the Tx output end in any single band homebrew kits. Isn't BPF better than LPF in filtering out the "unwanted" stuff and make your transmitted signal cleaner? On the receiver end it almost always uses some sort of BPF in these single banded designs.
Please enlighten me. Thanks.

DJ Wang/ KE3ZB

Hi Glen,
I have the TS-520S with the DG-5. I realize you are looking for the
Kit,
and you will probably get the info, but its worth considering that the analog
calibration
on the 520 series is pretty good. Unless you have a real need for digital
readout, the rig as is capable of putting you almost bang on to the Kilocycle,,
and even by eyeball interpolation, probably within 200 Hz if not less! I've been
in thehobby for many years, and have had a number of pretty fancy stations,
towers, beams and such. I sold it all a few years ago, and only recently decided
to get on the air again. My first priority, and there are many local hams who
will vouch for the following, was to find a 520, (I didn't care if it was a 520
or a 520S) because I maintained it was one of the best rigs ever built, and
because I was impressed with its performance. I found one at a flea market
earlier this year and love it. Enjoy, and if I can be of tech assistance let me
know -- I know the 520 series inside out. I just don't have anything on the DK-5
(Murphy!)

I have a very clean TE Systems 0550 G amplifier. The amplifier does about 360 Watts with 10 watts in. The amplifier is in great working condition. The unit uses 4 (MRF492) transistors. A couple of months ago I blew up one of the four transistors due to antenna problems. I replaced the right side symmetrical pair with a new matched pair. The amplifier is back to normal and has been used for a couple of months with no problem. I will supply the unit with a match pair of new MRF492 as spares. The amplifier sales new for $484. I will ship it anywhere in the US with the spare transistors(2) for:

$375

For a certain amount of rejection (say 50 dB) of out-of-band harmonics the BPF requires twice as many LC components as an LPF. Usually the harmonics are the things that need to be filtered, so the LPF makes more sense, usually.

Cross-posted to: alt.dbs.echostar,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.space,rec.radio.scanner,rec.radio.swap,sci.electronics.components

I have a box of new KU Band LNB's. Input frequency is 11.7 to 12.2 GHz and output is 950-1450. Units are new in the box. The units are conservatively rated at 1.2dB NF. These are high quality units with guaranteed Noise figure performance. Most LNB's out there are rated at .7 dB, but really have 1.0++ NF. These units use a DRO module at 10.75 GHz. The module can be easily removed. I have soldered an SMA cable where the module was located to insert a different LO. With minor tuning I got them to receive great at 10 GHz.

I will sell them for $30 each or 5 for $105 including shipping. These LNB's produce perfect P5 pictures on most birds with a simple 3 foot dish antenna.

That polypropylene rope was probably coloured , perhaps blue or orange.
The pigment is the problem.
Black polypropylene (with carbon black) would definitely survive.

This problem has been recognised by industry for a long time.

Coloured plastic tubing which is exposed to sunlight (even light from
fluorescent tubes
in control buildings) is nowadays supplied as black tubing with
coloured stripes with
the colour identifying the service.

Source record: 76979

Jim, WA0AXB, asked about the ability of plenum-rated cable to withstand the weather and ultraviolet radiation. Some good replies were given by Jim, N8EE, my old friend Tom Bruhns, and Roy, W7EL.
Before commenting on PTFE (polytetrafluoroethylene, the generic name for DuPont's Teflon(r)), let me mention that not all plenum-rated cable is PTFE insulated. Kynar (r) (polyvinylidene difluoride), Tefzel, Kel-F, some FEP's and some other plastics may also be used. Most of these, fortunately, have similar characteristics to PTFE for your application.

PTFE will hold up to weather just fine. It will shrug off acid rain, ozone, and virtually all air pollutants. UV resistance is variable. PTFE does not hold up to ionizing radiation well at all. Thus short-wave ultraviolet (UVA) can eventually do some damage. Long-wave ultraviolet (UVB) should not damage it at all. So if WA0AXB lives in a high altitude desert (as opposed to the nearly underwater Tom), his cable might suffer some UV damage by 50 years or so. If the jacket is pigmented in black or another dark color, it might last even longer. Likewise if titanium dioxide filler is used to make it bright white, it should last a looong while. So avoid using X-rays on it too often and keep it away from neutron sources.

The abrasion resistance mentioned is somewhat confusing. PTFE is slippery and is a good lubricant. However its true abrasion resistance is not that good. Rough materials sliding over a PTFE surface will soon wear away the PTFE.

If you have more questions about PTFE, please ask. I was recently employed by W. L. Gore & Associates, the world's largest consumer of PTFE resins, in their central research and manufacturing facility. PTFE is amazing material, and I learned things about it that still are difficult to believe. Some of the Gore chemists talked of PTFE as being almost a living material.

Unless someone comes up with a specific answer here is my recommendation. Because the fault is intermittent, and because at times it does work properly,
I would almost suspect an intermittent connection, possibly a cold solder joint. You might be able to confirm this by giving the unit and quick bang on
the cabinet with your hand and seeing if the problem changes. This may sound
crazy, but I have been a technician for many years and this technique has worked for me in many cases.

4677. SECO Tube Tester Questions

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-13 00:00:00 UTC
From: John & Amy Hern <hern@nidlink.com>
Message-ID: <364C3565.3C49@nidlink.com>
Source record: 76988

Can anyone tell me how this unit is supposed to work?

It is marked "Seco VT Grid Circuit Tester" "Model GCT-5" It has three tube sockets on the left, a bullseye tube marked "Bad-OK-Bad", a rheostat marked "zero set" and a filiment selector switch - 3,4,5,6-8,12 - in the center. On the right are five more tube sockets. Each socket has a chart printed next to it, indicating what tube goes in it.

The unit lights up, and the rheostat opens or closes the eye, but I don't know the zero set or testing procedure.

Any comments?

Thanks,

John.

>Title : Using PIC Microcontrollers in amateur radio projects , by
>John A. Hansen , W2FS.
>

And look out for the bugs when you read it:

1. The programmer circuit is only just usable, if you're lucky. The PIC requires a voltage on pin 14 in the range 4.5-5.5v. With the circuit as shown, the voltage on my incarnation was about 4.4v -- sometimes the circuit worked, sometimes it didn't.

As a workaround, I replaced the 5.1v zener with a 6.8v, and added 2 more 1N4148 diodes in series with the existing one. This brought pin 14 up to 5.2v, and now it works like a champ, even with an 8-foot serial cable and a 233MHz PC.

2. On the circuit for the code practise oscillator, the RC oscillator components should go to the OSC1/CLKIN pin (16), not as shown.

: > cleaner?
:
: For a certain amount of rejection (say 50 dB) of out-of-band harmonics the
: BPF requires twice as many LC components as an LPF.

I do not quite follow this.

If we take a simple LC LPF with only one L and one C, the response
falls off by 12 dB/octave or 40 dB/octave of the _absolute_ frequency,
so the response is -40 dB at ten times the cutoff frequency.

While in a simple resonance circuit, the response only drops with 6
dB/octave (20 dB/decade) so to get 40 dB attenuation two decades (100
times frequency) is required. However, these octaves or decades are
measured as an _offset_ from the centre frequency (not the absolute
frequency from DC). Thus, with a centre frequency of 4 MHz and a
loaded Q of, say, 10, the -3 dB point is at +200 kHz (4.2 MHz), the
-20 dB point at +2MHz (6 MHz) and the -40 dB point at +20 MHz (24
MHz). The -40 dB point for a simple LC LPF with corner frequency at 4
MHz would be at 40 MHz.

The problem is that in order to maintain such high _loaded_ Q with
reasonable losses, the unloaded Q would have to be very much higher.
With the loaded Q as 10, the unloaded Q would have to be more than 70
for 1 dB (25 %) losses and more than 150 for 0.5 dB (12 %) losses.

That's interesting. I would have thought that a wire (one of the choices offered in the question) would have higher Q than a strip line. I'd think that the surrounding ground planes would lower the Q as it would for a shielded inductor. If the strip line is a conventional type where the line is embedded in dielectric, I'd think that the capacitance caused by the dielectric, and, if poor dielectric material were used, the dielectric loss, would also lower Q.

Why would a strip line have higher Q than a wire (which I'm assuming is suspended in air)?

(Incidentally, strip line wasn't included in the choices in the original question.)

I've used white, green, and black. The black lasts the longest, but all deteriorated after a while. And as I said, my location is nowhere near a worst case for sunlight exposure.

By "the pigment is the problem" do you mean that a pigment-free polypropylene rope won't deteriorate due to UV exposure?

I'd always thought that it was the plastic itself which was deteriorated by UV, and that making it black simply prevented the penetration of the UV to the interior of the rope. Consequently, black rope degrades more slowly, as the outside layer has to deteriorate and fall off before the inner layer can deteriorate. That is, the pigment is the solution (as much as the problem can be solved) rather than the problem.

Roy,

You are absolutely correct. Filling the plastic with carbon black prevents the light from going past slightly below the surface. Thus the surface degrades. If the degraded surface can fall off, more plastic will be exposed and the process will continue. Another additive is titanium dioxide, which is a highly reflective white. Instead of absorbing the ultraviolet, it reflects most (but not all) of it back out.
For longevity, you should not use polyolefin ropes at all (polyethylene and polypropylene). Nylon is much better, and polyester ropes are the best of all for ultraviolet resistance. Dacron is just DuPont's name for their polyethylene terephthalate polyester fiber, and it is popular for outdoor fabrics. Polyesters by other manufacturers are similar. For _really_ high UV resistance, the polyesters can be produced with internal ultraviolet absorbers in the polyester backbone.

Hi, Shawn,

You've received some pretty good leads to decent homebrew audio amplifiers, but if quality is important, you need to consider using the Philips TDA 2611 (in a 10-pin package) IC in your next project. It is what may be the best audio amp in the world for small projects and is easily available from both Newark, Orvac, Dow, and (I believe) TechAmerica.

This chip is used in all of Ten Tec's modern transceivers, for example, and in many of their kits. It sounds awesome. With four or five external parts, it is quite simply the best-sounding amplifier I've ever used.

Whatever you end up using, good luck, and please feel free to contact me individually for further information.

R,

Al W6LX

Terry

I would suspect an FM transmitter would be far more efficient because of the extreme losses involved in using a short AM broadcast antenna. You might check with Ramsey--I believe they offer some FM transmitter kits that would be ideal for your needs.

:
: For a certain amount of rejection (say 50 dB) of out-of-band harmonics the
: BPF requires twice as many LC components as an LPF.

I do not quite follow this.

If we take a simple LC LPF with only one L and one C, the response
falls off by 12 dB/octave or 40 dB/octave of the _absolute_ frequency,
so the response is -40 dB at ten times the cutoff frequency.

While in a simple resonance circuit, the response only drops with 6
dB/octave (20 dB/decade) so to get 40 dB attenuation two decades (100
times frequency) is required. However, these octaves or decades are
measured as an _offset_ from the centre frequency (not the absolute
frequency from DC). Thus, with a centre frequency of 4 MHz and a
loaded Q of, say, 10, the -3 dB point is at +200 kHz (4.2 MHz), the
-20 dB point at +2MHz (6 MHz) and the -40 dB point at +20 MHz (24
MHz). The -40 dB point for a simple LC LPF with corner frequency at 4
MHz would be at 40 MHz.

The problem is that in order to maintain such high _loaded_ Q with
reasonable losses, the unloaded Q would have to be very much higher.
With the loaded Q as 10, the unloaded Q would have to be more than 70
for 1 dB (25 %) losses and more than 150 for 0.5 dB (12 %) losses.

I've used white, green, and black. The black lasts the longest, but all deteriorated after a while. And as I said, my location is nowhere near a worst case for sunlight exposure.

By "the pigment is the problem" do you mean that a pigment-free polypropylene rope won't deteriorate due to UV exposure?

I'd always thought that it was the plastic itself which was deteriorated by UV, and that making it black simply prevented the penetration of the UV to the interior of the rope. Consequently, black rope degrades more slowly, as the outside layer has to deteriorate and fall off before the inner layer can deteriorate. That is, the pigment is the solution (as much as the problem can be solved) rather than the problem.

>Title : Using PIC Microcontrollers in amateur radio projects , by
>John A. Hansen , W2FS.
>

And look out for the bugs when you read it:

1. The programmer circuit is only just usable, if you're lucky. The PIC requires a voltage on pin 14 in the range 4.5-5.5v. With the circuit as shown, the voltage on my incarnation was about 4.4v -- sometimes the circuit worked, sometimes it didn't.

As a workaround, I replaced the 5.1v zener with a 6.8v, and added 2 more 1N4148 diodes in series with the existing one. This brought pin 14 up to 5.2v, and now it works like a champ, even with an 8-foot serial cable and a 233MHz PC.

2. On the circuit for the code practise oscillator, the RC oscillator components should go to the OSC1/CLKIN pin (16), not as shown.

That's interesting. I would have thought that a wire (one of the choices offered in the question) would have higher Q than a strip line. I'd think that the surrounding ground planes would lower the Q as it would for a shielded inductor. If the strip line is a conventional type where the line is embedded in dielectric, I'd think that the capacitance caused by the dielectric, and, if poor dielectric material were used, the dielectric loss, would also lower Q.

Why would a strip line have higher Q than a wire (which I'm assuming is suspended in air)?

(Incidentally, strip line wasn't included in the choices in the original question.)

Roy,

You are absolutely correct. Filling the plastic with carbon black prevents the light from going past slightly below the surface. Thus the surface degrades. If the degraded surface can fall off, more plastic will be exposed and the process will continue. Another additive is titanium dioxide, which is a highly reflective white. Instead of absorbing the ultraviolet, it reflects most (but not all) of it back out.
For longevity, you should not use polyolefin ropes at all (polyethylene and polypropylene). Nylon is much better, and polyester ropes are the best of all for ultraviolet resistance. Dacron is just DuPont's name for their polyethylene terephthalate polyester fiber, and it is popular for outdoor fabrics. Polyesters by other manufacturers are similar. For _really_ high UV resistance, the polyesters can be produced with internal ultraviolet absorbers in the polyester backbone.

Hi, Shawn,

You've received some pretty good leads to decent homebrew audio amplifiers, but if quality is important, you need to consider using the Philips TDA 2611 (in a 10-pin package) IC in your next project. It is what may be the best audio amp in the world for small projects and is easily available from both Newark, Orvac, Dow, and (I believe) TechAmerica.

This chip is used in all of Ten Tec's modern transceivers, for example, and in many of their kits. It sounds awesome. With four or five external parts, it is quite simply the best-sounding amplifier I've ever used.

Whatever you end up using, good luck, and please feel free to contact me individually for further information.

R,

Al W6LX

The original Ludi circuit called for a 5.6 v zener. I wanted to use parts that were readily available at local radio shack stores here in the states so I swapped it for a 5.1 volt. I've not had luck with a 8 foot serial cable, but with little or no cable (I generally just plug the programmer directly into the serial port) I've built 25 of them and tested each one. They all worked. I've also tested them with several different computers (including a laptop) and they worked.

Radio Shack has a simple kit for about $15. I've built two of them.
They're easy to assemble, and they work fine. You could do it a little
cheaper buying the parts yourself, but not much cheaper.

Terry

I would suspect an FM transmitter would be far more efficient because of the extreme losses involved in using a short AM broadcast antenna. You might check with Ramsey--I believe they offer some FM transmitter kits that would be ideal for your needs.

Unless someone comes up with a specific answer here is my recommendation. Because the fault is intermittent, and because at times it does work properly, I would almost suspect an intermittent connection, possibly a cold solder joint. You might be able to confirm this by giving the unit and quick bang on the cabinet with your hand and seeing if the problem changes. This may sound crazy, but I have been a technician for many years and this technique has worked for me in many cases.

My GPS puts out a big spur on one of the local repeater output frequencies. (I assume this is what you're referring to.) My solution is to turn the 2 meter rig off, since there's very seldom anything on it that interests me. But if I did want to solve the problem, I'd design and build a little highpass filter to go between the GPS unit and its antenna. (Mine has a detachable antenna.)

I agree, somewhat.We can compare LPF vs BPF for filters of the same type, for example a 0.1 dB Cheby LPF and a 3 dB cutoff freq of 4.0 MHz, with a 0.1 dB Cheby BPF with a 3 dB bandwidth from 3.5 to 4.0 MHZ.

Note that the LPF has 3 components and when we transform this filter to a BPF, there are 6 components. Each shunt capacitor of the LPF is tuned by a shunt inductor and each series inductor of the LPF is tuned by a series capacitor.

I simulated this, starting with a 3-element 0.1 dB Cheby lowpass prototype filter, and used the ARRL Radio Designer Program to plot the frequency responses of both the LPF and the BPF simultaneously.

I was interested in the response at 7.0 MHz, which is twice the low end of the 80 meter band.

The result was that the BPF was much better (by more than 40 dB) at 7.0 MHz. However, the LPF required only 3 components and the BPF needed 6 components. These extra components caused the large improvement.

But if the BPF is designed using only 3 components, rather than 6, the results are a lot different. This BPF could be a resonant PI or T network such as in an antenna tuner. I also simulated a resonant PI network with a Q of 10 and a 3 dB bandwidth from 3.5 to 4.0 MHz. It was about 10 dB better than the Cheby LPF at 7 MHz, but still about 30 dB worse than the 6 element BPF.

The conclusion is that for an equal number of components the resonant filter is better by about 10 dB (for the typical example that I used and for the second harmonic) but not nearly as good as the 6 element filter, which is a 3 element LPF protoype "transformed" to a 6 element BPF.

My previous response should be reworded:

For the same number of components, say 3, the resonant PI or T BPF will probably do a little better at second harmonic reduction than a conventional LPF. The BPF must be tuned to resonance, whereas the LPF does not (set-and-forget). It is still true though that usually harmonic reduction is what an xmtr is interested in. One or two extra parts in an LPF will make a resonant filter unnecessary and make the LPF to BPF transformation unnecessary and undesirable. The problem with 50 ohm BPFs is that for narrow bandwidths such as the HF ham bands, large L/C ratios (series) and large C/L ratios (shunt) are needed. We usually have to design for 450 ohms or so, and then transform from 450 ohms to 50 ohms at the input/output, which can increase the parts count and is certainly more effort in building and tweaking, etc. The BPF is a lot of trouble for an xmtr if only harmonic reduction is needed.

Another point that there has always been some bandpass filtering earlier in the exciter. In modern transmitters that use frequency mixing, there are many possibilities for generating unwanted signals quite close to the output frequency, on both sides. This requires bandpass filtering, and the passbands often need to be quite narrow or steep-sided. This requires high working Qs in the filter, which are much easier to realize at low power levels because there are no problems about high RF voltages or currents leading to component breakdown.

If the bandpass filtering in the exciter is effective, the PA is being driven by a spectrally pure signal. That means there is no possibility of the PA generating new frequencies close to the wanted output. The only new frequencies that can be introduced are the harmonics (2f, 3f etc) and the appropriate treatment for those is a lowpass filter as Bill says.

Alternatively, in situations where the frequency is fixed (eg in repeater transmitters) or is varied very little (eg when operating only within the narrow VHF/UHF weak signal sub-bands) a better and simpler alternative to a lowpass filter can be a filter that generates a series of very narrow notches at the harmonic frequencies - see examples on my web pages.

Perhaps we should also mention that add-on bandpass filters ARE popular with VHF/UHF amateur transceivers, but that mostly for the non-technical reason that bandpass filters are almost the only ones commercially available for VHF/UHF (eg the ICE range). Their main benefit is not to the transmitter, but in reducing receiver problems from high-power pagers just outside the 2m band.

>
>Why would a strip line have higher Q than a wire (which I'm assuming
>is suspended in air)?

All these types of resonators are actually short sections of transmission line, which has to include some kind of enclosure or groundplane. A wire operating truly "in air" would radiate RF. That would be a good thing if the wire was an antenna; but if it's a resonator in a tuned circuit, the RF radiation is a source of loss that will reduce the Q (and may also introduce problems with unwanted coupling to other parts of the circuit).

The highest-Q inductors at UHF are sections of strip or rod line in an enclosure, or sandwiched between two groundplanes with considerable overhang at the edges. Air or vacuum is the best dielectric.

For example, it's difficult to obtain an unloaded VHF Q much greater than 50 for an inductor etched on G10 fibreglass PC board. This is due to a combination of effects: dielectric losses, RF radiation from the fringing fields in the air above the board, and copper losses (especially skin-effect losses at the interface with the dielectric, where the copper surface is very rough).

The most appropriate inductor construction is probably the one that gives just enough unloaded Q for the particular application.

Quite true. If exciter spurii get into the PA they can intermodulate with the main signal and its harmonics to produce much garbage.

Yes. This is why it is very important that the minimum bending radius be carefully observed. It is especially true with the semi-solid dielectric coax cable too.

The original Ludi circuit called for a 5.6 v zener. I wanted to use parts that were readily available at local radio shack stores here in the states so I swapped it for a 5.1 volt. I've not had luck with a 8 foot serial cable, but with little or no cable (I generally just plug the programmer directly into the serial port) I've built 25 of them and tested each one. They all worked. I've also tested them with several different computers (including a laptop) and they worked.

The following is available..

Navico AMR1000s .... boxed
copy of Icom IC2e + 4 battery packs (condx of batteries unknown) .. boxed
Microwave Modules 2m/10m transverter
Radcom Spectrum analyser (0-110Mhz).. unfinished project but working ok
Scope .. Farnell DTV 12-14 12Mhz Dual Trace Fully transistorised (except
tube!!)
Sig Gen.. synthesized 300Hz-99.999999 Mhz in 1Hz steps (output 1v into
50R)
RTTY / ASCII sig gen programmable baudrate, bits, starts,stops,code,
messages etc..
Radio Spares UV lightbox + 2 spare tubes
-- also numerous I.C's for rf , digital etc.. caps,.. resistors...
transistors..ring mixers etc..

I use two products to program PIC's. The Needham's Electronics EMP-10 is a bargain and they have outstanding tech support. See www.needhams.com. This programmer will program the baseline PIC's (16C54, 55, 56, 57), not to mention most common EPROM's and 8751's.

I also purchased a MicroEngineering Labs EPIC programmer. This is supposed to work with DOS, Windows 95 and Windows NT. I have only used it with DOS and Windows 95; it works fine on both of these. It will program most of the midrange PIC's (12C5XX, 12C6XX, 14CXXX, 16C5XX, 16C6X, 16C7X, 16C8X/16F8X). See www.melabs.com.

I have for sale 2 complete twt setups <unk if working>
came from older ham getting out of equipment....
they are Alfred model 502 and model 562
I have another that was part of a 2304 station <not selling>
that showed 200mw output on a bird microwave wattmeter.
make resonable offer, they ARE heavy and are listed
from 2-5 gig outputs ranging from 100-220 mw <on test sheet>
N connector in and out.
<these units are complete with power supply and all, plug in and use>

I also have 3 Thompson-CSF Th3543c TWT, that list from 5.925 to 6.435
gig collins part @ 270-0634-010 with test data
5.5 volt
2.5kv anode
1.5kv collector
1.5 milliwatts in for 10 watts out
33 db gain
These were said to work fine on 5 gig ham band
and have reduced gain on 3 gig ham band <around 20db gain>
they have SMA connectors, and NO power supply.

I also have rectifier tubes, and thousands of others. Guitar amp tubes
are probably spoken for already.....
NO sweep tubes

also I have a limited supply of 381 <2c39> tubes

********remove nospam to reply*********
see ya on the bands

The filter would also have to pass the 5 volts or so DC used for the
preamp in most remoe antennas. The effectiveness of the filter assumes
that the re-radiation is via the antenna terminals.

I would recommend considering one of the OEM style receivers mounted
inside of a sheilded case.

Instead of cutting the fence and letting your neighbor's dogs escape,
why not offer to install a couple of RF chokes in-line with the antenna
loop at the fence transmitter, possibly with capacitors to ground on the
other side of the chokes? You should be able to stop the fence's
emissions dead at 50 - 100 kHz or so with no effort at all.

The FT-50's display is called "Omni-Glow", and it's just an ordinary
LCD which is backlit (really sidelit) by an orange LED.

I don't know if that extends to the 2500, though.

Maybe "Omni-Glow" means nothing more than "backlit".

On Sun, 15 Nov 1998 11:32:25 -0600, "William E. Sabin"
<sabinw@mwci.net> wrote:

: But if the BPF is designed using only 3 components, rather than 6, the results
: are a lot different. This BPF could be a resonant PI or T network such as in an
: antenna tuner. I also simulated a resonant PI network with a Q of 10 and a 3 dB
: bandwidth from 3.5 to 4.0 MHz. It was about 10 dB better than the Cheby LPF at
: 7 MHz, but still about 30 dB worse than the 6 element BPF.

Did you compare the response at very high frequencies, such as 30 MHz
or 100 MHz ?

Returning to my previous post, I noticed a practical problem in my
approach with two element band pass or low pass configuration.

While the bandpass response from a parallel resonance circuit
initially drops at 6 dB/octave calculated from the offset from the
centre frequency, this drop does not continue forever, since sooner or
later, the frequency response will asymptotically approach -
6dB/octave calculated in absolute frequency, since there is only one
active reactance at very high frequencies.

With a loaded Q of 10, the resonance peak would only be 20 dB high, so
the 20 dB/decade drop relative to the offset could only continue about
one decade (with 200 kHz x 10 or +2 MHz to 6.2 MHz in the 4 MHz
centre frequency case), where the attenuation is about -20 dB, after
which the drop could be about 20 dB/decade measured with the absolute
frequency.

With a loaded Q of 100, the resonance peak would be 40 dB and the
fast drop could continue for two decades (with 20 kHz x 100 or +2 MHz)
to the same frequency as in the previous case, but with an attenuation
of -40 dB , thus the attenuation level would be 20 dB better at this
frequency or higher frequencies, compared to the Q=10 case.

However, in order for a loaded Q of 100 to be practical in an power
amplifier and to keep the losses at a reasonable level, the unloaded Q
would have to be in the order of 1000, which is impossible for lumped
components at HF.

Some cavity or coaxial resonators might have this kind of unloaded Q,
but they are practical on 144 MHz and above. For such resonators, in
addition to the wanted 1/4 wavelength resonance, there are also the
3/4, 5/4 etc. resonances, so the suppression of odd harmonics would be
minimal, if not extra tuning capacitance is used to move the 3/4, 5/4
etc. resonances away from the multiples of the fundamental frequency.

Since these Q values would be impractical on HF, two stages with lower
Q would have to be used with twice the number of reactances, so much
would not be gained, if anything using BPFs.

: For the same number of components, say 3, the resonant PI or T BPF will probably
: do a little better at second harmonic reduction than a conventional LPF. The
: BPF must be tuned to resonance, whereas the LPF does not (set-and-forget). It is
: still true though that usually harmonic reduction is what an xmtr is interested
: in. One or two extra parts in an LPF will make a resonant filter unnecessary and
: make the LPF to BPF transformation unnecessary and undesirable. The problem with
: 50 ohm BPFs is that for narrow bandwidths such as the HF ham bands, large L/C
: ratios (series) and large C/L ratios (shunt) are needed. We usually have to
: design for 450 ohms or so, and then transform from 450 ohms to 50 ohms at the
: input/output, which can increase the parts count and is certainly more effort in
: building and tweaking, etc. The BPF is a lot of trouble for an xmtr if only
: harmonic reduction is needed.

Good points. So with different approaches, we reach similar
conclusions why BPFs are not used in transmitter output stages at
least for harmonics suppression.

>Yes. This is why it is very important that the minimum bending radius be
>carefully observed.

Temperature also has an effect, but at reasonable operating temperatures and low amateur duty cycles, cold flow should never be a problem within the lifetime of the coax if you respect the manufacturer's minimum bending radius.

Even in an extreme example where a coil of RG213 was being used as an RF power attenuator in a UHF TV transmitter (so was deliberately being allowed to get warm), it still took 7 years of continuous broadcast service before the inner conductor had migrated outwards to touch the shield.

>It is especially true with the semi-solid dielectric
>coax cable too.

It also depends a lot on the construction. Worst are the cables like 9913 where the spacing is achieved by an un-secured spiral of PE cord. When such cables are bent sharply, it's very easy for the inner conductor to move off-center because the spiral support is free to move longitudinally. This can also make the inner pin of a coax connector pull inwards or push outwards, and will probably tear the foil wrap as well.

>
> Did you compare the response at very high frequencies, such as 30 MHz
> or 100 MHz ?

No, and the reason is as follows:

In solid state push-pull PAs. which is what I am mostly concerned about, the third harmonic is the worst offender, being only about 15 dB or so below the fundamental. The second harmonic is typically 30 to 40 dB below the fundamental and much easier to filter. Higher harmonics such as the 4th and 5th are sufficiently small that very large attenuations are not needed. At HF and at power levels of 100 watts, 40 dB is acceptable to the FCC, and I try to get 55 dB minimum.

At very high harmonics, leakage sround the filter is quite often the limiting factor.

>behind the times, technologically?!)

You need a real programmer, not bits of logic hanging off a PC port letting the PC do the work. There are straight RS-232 programmers for various microcontrollers out there that will work under NT or on a Mac. Just keep searching and expect to pay more. The other alternative besides using raw CPUs is to use eval boards, potted modules, and the like with built-in monitors that can program themselves serially.

>Are Intel or Moto any better?

Yes and yes, IMO. More exactly, Moto and improved-upon clones of Intel.

>Both at work and at home I run an all-NT shop.

I feel for you.

>What's a minimum setup I need to start experimenting with this technology?

Pick up copies of Circuit Cellar INK and Nuts & Volts magazines at the bookstore. You'll find plenty of examples.

look for the seams where it is glued and pry with an exacto knife. use a little finess,
easy on the force and in several places. some pack open up easy and some never come apart. Wear some safety glassses.

Interesting. I have a radio fence in my backyard and the wire runs
less than 15 feet from my shack (thru the basement). I have not
had any problems with noise from it. Why don't you have the
neighbor put the dog inside for a bit, turn it off and see if that
is really the problem.

Not that it is the right group but I will digress:
An invisible fence is a TRAINING device, it is not a
containment system of any kind. Properly used, the radio
collar can be removed when training is complete and the
dog should still never leave the yard. There is nothing
inhumane or harmful about it if it is properly used. Like
most other things (even amateur radio) it is only as good
as the people who use it.

Is there any reason not to just use a simple linear regulator like
a 78L05 for the power supply to the chip? These are readily available
(even at Radio Shack). This also would steal less power from the TxD
pin.

there IS such a thing as Elf...(extremely low freq's) there is also some amateur activity there, as well as military, etc. if you saw the same x-files i did, what they were taqlking about are radio waves at about 400 kilohertz, or 0.4megahertz.... the situation they were talking about is theoretically possible, but highly unlikely, as a human head is resonant at about 400MHz, and if you looked at a chart of harmonic frequencies for 0.4MHz, it would show almost a flat line at 400MHz, for more info on both ELF ("Lowfers") and resonance and harmonics, you may want to look at the ARRL Handbook, and the ARRL antenna book. (ARRL is the American Radio Relay League). 73.

Both you gentlemen who replied are correct. Most of the radiation is
out of the unit itself rather than the antenna. I confirmed this by
replacing the antenna with a good termination. My proposed solution of
a highpass filter wouldn't work. It would be difficult to shield a
typical GPS unit while keeping the display visible, but this is what
you'd have to do.

made a dummyload of N-type chassis male connector with small tinned iron plate (easier to solder with a small iron) attached with 4x M3 screws. mounted 6x 300 ohm 1W resistors in a circle from center shortest way to ground.
Reflection loss was measured at Weinheim (Germany) VHF convention by Rohde & Schwartz technician to at least 15dB up to 1300MHz
It proves that with ordinary resistors it is easy to build your own relatively useful terminations for simple applications on UHF up to at least 1296MHz, they are good enough for transmitter tests, but may not suffice for some measurements.
Has used the load for testing VHF/UHF transceivers with up to 15W RF for several minutes, the resistors looks "burnt", but still works fine, have included a simple 25dB attenuator with BNC o/p socket for frequency counter and deviation meter (or signal generator).

Resistor type Draloric Electronic GmbH Type LCA0414 (believe it is an ordinary carbon resistor, not meant to be particularly good on VHF)

>DJ Wang/ KE3ZB

If you look at some of the older rigs, from the 30's, 40's, and 50's, you will find that they do use 'band pass filters'.

Actually, they where called 'parallel tuned tank circuits' and usually had a linked coupled output, and could usually be adjusted to match any impedance. They did, in my opinion, a better job of filtering because they could filter not only the harmonics, but the sub harmonics (sometimes a lower frequency crystal was multiplied to arrive at the desired frequency).

I beleive what you are refering to as a 'low pass filter' is the PI network output. The advantage of the PI network is that it is easier to bandswitch. It is also easier to design the network to operate with any given (and known) impedances. PI networks are also more broadband than parallel tuned, and do not need to be 'tweaked' as you tune around in a band---hence they are better suited for VFO operation, as compared to crystal controlled as in the older rigs.

The above was concerining tube rigs. For the newer solid state, the reason the PI network is used is because it is easier to design for the required impedance matching, as also mentioned above.

Yes, there is. The different 'bands' are defined in the FCC regulations as:

frequency band
3KHz-30KHz VLF
30KHz-300KHz LF
300 KHz-3MHz MF
3MHz-30MHz HF
30MHz-300MHz VHF
300MHz-3GHz UHF
3GHz-30GHz SHF

I do not recall that the FCC defined ULF, as there are no regulations
covering that band, but if there where it would be from 300Hz-3KHz.

Peter, you have hit it. I can't believe that anyone who has more than 72 hours of computer experience would run 95/98 rather than NT.

Like you, I run NT at home and the office. In fact we are not allowed to sell a machine with 95/98 installed on it. We have gotten way too much business from our competitors who do sell 95 as a viable solution for businesses.

I am also an electronics hobbyist since the early '70s. But I do S-100 Altairs with 8080/85/Z80s and I am fortunate enough to have found enough compilers, assemblers, debuggers, and emulators that WILL run under NT.

The last volley in this insanity was getting an HP Office Jet fax/printer/scanner. Tried to install it and couldn't find any NT drivers in the box. Called HP and the idiots informed me that they didn't support their office jet on NT. They didn't even seem to understand what was so ridiculous about that statement. ("Does the word OFFICE mean anything to you folks???"). Maybe they should call it a Home Jet.

I have never done PICs but it is hard to believe that the tools are not available for NT. Dumb.

I've been soldering wires to untabbed NiCd cells for at least 15 years
and have never seen any unusual effects, heat-related or otherwise.
In fact, I never considered that there should be any problems!

I lightly sand or scrape the area to which I want to attach a wire,
daub some flux on it, and solder it.

Hi John.....well, wire cutters aside, I'd figured a good lowpass filter
would do the trick. I took a look at the system and there's not much
of a place to put in a filter. The box is riveted together and just sorta
hung on the wall. I lucked out though, the guy and his dogs went
elsewhere and left the antenna laying in the weeds around the place.
After do consideration, I came to the conclusion that the wire is that
"Flexweave" conductor that would make really fine antennas, so I
may offer to clean up the mess when the new owners move in.

Correct!
It is a training device, but sorry to say it is misused all the time.
But then again, I feel it is in 99 per cent of the cases a much to big
gun to use. Most dogs do NOT need this. It is sort of lazy dogtrainers
way of handling the dog. There might be cases that the collar WILL be
the best way to train the dog in a very specific situation.

But flipping thru the pages in an american dog magazine I see 10 ads
for this wounderfun gizmo, that are forbidden to use in many countries
as being cruel to the dog, and somehow in these countries the dogs are
just as well trained as in the US.... Makes at least me think for a
second or two...

Cheers

there are no FCC regulations for freqs below 9khz.

the Longwave Club of America has some older articles on ULF. a few souls have built beacons at 900hz, using spark coils as tuned spark transmitters.

they work, dont laugh.

the navy has it's ulf antenna on the bottom of lake michigan, and toe soviets use their submarine comm system at 75hz.

How are the 75Hz signals modulated? Or is it for CW communication
only? The frequency seems too low to usefully modulate for voice
or high rate data.

Anybody out there useing fiber optics as a link to remote equiptment?

I am interested in doing this if I can find enough info ot mux info/voice to control eq in a remote shack. Any info appreciated..Mike..KA1IFQ.

4804. Spectrum Analyzer concepts?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-17 00:00:00 UTC
From: Peter Bolch <nc-bolchpe@netcologne.de>
Message-ID: <72sc2n$efl@news.netcologne.de>
Source record: 76719

Hi,

I'm thinking of building a simple RF spectrum analyzer/selective level meter. Range of frequency
is 100 kHz to 1 GHz. The dynamic range should be at least 60 dB, a minimum bandwidth of 100 - 500 kHz will do at the moment.

What are the disadvantages/problems (e.g. images, spurious response) with the 4 concepts named below?

single conversion, very low IF (a broadband signal generator is available)

single conversion, IF 500 MHz, VCO frequency 500 - 1500 MHZ

double conversion, first IF 500 MHz, VCO frequency 500 - 1500 MHz

double conversion, first IF 2000 MHz, VCO frequency below IF

Any suggestions or ideas?

Peter

Hello Yongsup,

I have built some small amps using 2 MRF512's, for 40W out Class C (I
only
operate FSK and CW), using a surplus 24 V switching supply. At less
than
$1 each, they are a nice solution for a stand-alone rig or as a driver
for
a GG amp.
For high power, you can't beat the price of an old SB220 amp, or
similar.
While I too enjoy building solid state gear, it has to be cost
effective.
With so many other less expensive solutions out there, I find that I
have no
enthusiasm for spending a lot of money to make it 'solid state', plus
the
risk (it will happen!)of blowing up one or more expensive FETs. Add
to this the difficulties of making high-current, low-voltage power
supplies,
and the higher-impedance levels of the tubes are a real advantage, in my
view.
The only thing you may gain is smaller size and/or weight. How much is
this
worth? Individual decision, of course.

73 and GL,
Don W6JL

4806. FS: Duroid microwave PC Laminate

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-17 00:00:00 UTC
From: Brad Thompson <Brad_Thompson@pop.valley.net>
Message-ID: <3651DAE9.7347@pop.valley.net>
Source record: 76721

Hello--

I'm offering another (but larger and less expensive) batch of
microwave-grade printed-circuit board laminate. My hunch is that
this batch will sell quickly, so order soon to avoid disappointment<g>.

73,
Brad AA1IP

****

Rogers RT/duroid 5880 microwave-grade printed-circuit laminate for sale:
consists of two layers of 0.5-ounce rolled copper foil bonded onto a
0.031-inch core of glass microfiber-reinforced Teflon (tm) dielectric.
A layer of transparent peelable plastic file protects each copper
surface, rendering the copper shiny and probably ready to etch as-is.

Each board carries a Rogers label and measures 8.125 inches by 12.125
inches. Detailed specifications are available at the Rogers web site:
http://www.rogers-corp.com

Dielectric constant K= 2.20 (typical)+/- 0.02
Dissipation factor at 10 GHz (tan delta)= 0.0009

Price: $10.00 per piece; or $20.00 for three pieces, plus $3.75 for
insured priority-mail shipment (U.S. only). Canadian purchasers, please
inquire for postage.

***

Also available: Rogers RT/duroid 5870 microwave-grade SINGLE_SIDED
printed-circuit laminate: one layer of 0.5-ounce rolled copper foil
bonded onto a 0.031-inch core of glass microfiber-reinforced Teflon (tm)
dielectric. A layer of transparent peelable plastic file protects the
copper surface, rendering the copper shiny and probably ready to etch
as-is. Each board carries a Rogers label and measures 8 inches by 9
inches.

Price: $5.00 per piece; or $10.00 for three pieces, plus $3.75 for
insured priority-mail shipment (U.S. only). Canadian purchasers, please
inquire for postage.
***
Shipment restrictions:

Please note: this material is for sale to Canadian and U.S. purchasers
only. Foreign shipments of unfabricated RT/duroid require an export
license and may be subject to shipping restrictions.

I accept payment via personal or cashier's check or money order drawn in U.S. dollars and made payable to "Brad Thompson".

Warranty policy:

If you purchase these boards and find them unsatisfactory upon your visual inspection, you can return your unused boards in as-received condition for a full refund within seven days.

This material is subject to prior sale and is supplied as-is, as new-old-stock (NOS) merchandise, with all responsibility for safe and successful application residing solely with the purchaser.

a parallell tuned anode circuit with loaded Q of 5-15 isn't much filter
in any respects, a bandpassfilter is minimum two tuned circuits.
Harmonic radiation from such transmitters was poor, they couldn't even
suppress 2nd or 3rd harmonic sufficiently, so to avoid TVI we had to
change to pi-filters.

***** I've done it for decades also. I scratch the surfaces with
emory cloth first and then use the iron to
"scrape" solder into the surface. As soon as I get a bead,
I stop and let it cool. Then, I can quickly attach a tinned
lead without much heat since I only melt the top of the
solder bead..... Seems to work well.....

Since I don't have a way to check the integrity of the
seals, I can't dispute it. But it does not degrade them
enough to make any difference to my projects.....I get
several years of life out of even "used" nicads...

I have a few in my junk box also. It is a VHF transistor made
for the aircraft band for AM transmitters with a 12 volt B+.

I got mine about 25 years ago and the company that makes them
went out of business about 24 years ago I think.... I don't
remember the name or whether someone bought them.

Anyway, they are not great on gain. Memory, which is a bit
dim now, says they run about 20 watts output at 12 Volts on
collector and have a gain of 8-10 db at 144 Mhz. I used them
for homemade 2 meter FM amps and on AM aircraft transmitters that
I designed for Bendix Avionics in the early 70's.

I may have mis-remembered a number or two above, but I
know the gist of it is correct....

From: freddie042@yahoo.com
Message-ID: <3651fdd1.2062640@news.compuserve.com>
Source record: 76731

Hi,

A friend of mine needs help !

He's just "smoked" the 3SK 124, dual-gate GAsFET in his 2 metre masthead pre-amp, and can't find one anywhere :(

Lots of suppliers tell him it's an obsolete type, but no one has suggested a suitable low-noise substitute, and he can't find it in his transistor book.

Anyone have any suggestions of what to use in its place, and possibly also a UK supplier ??

Alternatively, anyone know the parameters of the 3SK124 (or 3SK112 - also usable but obselete too), so we'd have some idea of what to look for ??

Many thanks,
Fred Sweeney

FS: at least 20 ea. 22 volt, 2.4 amp transformers, in plastic case, with jack for computer type ac cord (120V 60Hz input). About 4" cubed, 3.5 lbs. each, unused mint condition, $3.75 each or 4/$14 plus UPS. 36330 zip.(Alabama) Can be used with a rectifier and appropriate sized cap to power 28 V filaments, or as is for 21 V or 24 V sweep tube filaments. Also good for 24 V power supply. NOTE: Please REPLACE the "ns06" with "wor" to make "worley" or call 334-347-5281 day/eve/wknd.

Just as DUMB is NT's failure to offer direct simple I/O support for
its parallel port as an elective option. It's the MAIN BIG reason why
EVERYBODY hasn't upgraded, that and other backward old-MS-DOS
incompatibilities. People don't like buying all new everything every
5 years, and they won't put up with it. I doubt that NT will have any
better penetration than it does now in 5 years exactly because of this,
and IT SHOULD HAVE if only it was more reasonable about
back-compatibility for countless things. This is the reason WHY MS
didn't ditch Win95 and made Win98 instead of upgrading NT once more!
Pitiful strategy. I'll never upgrade till they honor simple I/O and
back-compatibility with old DOS programming and the vast DOS library of
freeware. And if they even think they can ditch all those programs they
had better be prepared to rewrite and compile every good ap that a lot
of folks like and give it away FREEE, and they sure won't want to do
that!! Win95 will probably sell or be pirated on a VAST scale past NT's
useful and obsolete little life for that reason!! This was ALSO why you
discovered, to your dismay, that such a big concern as HP didn't give a

shit about NT!!

Good point. I just followed the original article, which was intended as
an example of a very cheap programmer.

Someone else in this thread suggested buying a "real" programmer, but
what's the point? The programmer described in John's article only costs
pennies to build, and functions perfectly (once the design buglet is
fixed).

Actually, it's in the forest on the Upper Peninsula of Michigan. There
was some articles on it when some scientists found that the trees near
the antenna grew better. (From what I hear about the weather there,
any source of heat would help). There's also another transmitter in Wisconsin.

According to the great source of classified information, Popular Science
Magazine, the modulation is phase shift keyed at 1/16 hz.

The names they use in the public press are 'Saguine' and 'Seafarer'.

Peter Bolch (nc-bolchpe@netcologne.de) wrote:

: what kind of inductor (silver plated wire, microstrip transmission line or
: track on a PCB) will give in principle the highest Q at UHF frequencies?

Seeing if I can add to the noise already generated here... ;-)

"It depends." I think specifically it depends on the restrictions. If
you are unrestricted as to volume, then probably a silver plated "wire"
implemented as center conductor of the largest silver plated 77 ohm
coaxial cavity you can manage while maintaining TEM mode will give the
best, um, resonator Q. But if you are limited in space, and the coil
you want to implement is very small, so small that radiation will not be
a problem, then most likely an air-insulated coil well away from
conductors and insulators should be best. Interestingly, if radiation
is low enough (coil is small enough), the highest Q is NOT with the coil
in a shield as a helical resonator, but in the open, away from
everything. Of course, then the total volume taken up may be worse than
if you used the same volume for a much larger coil and a well-
controlled shield! Sigh. It all gets so complicated...as I wrote
above, it depends on the restrictions. As Ian suggested, watch out for
radiation; shielding will help that. But as Roy suggested, watch out
for shielding, because losses in the shield will lower Q; and watch out
for dielectrics because they will lower the Q through capacitance
(lowering the effective inductance) and through dissipation.

Someone who apparently did some serious testing for the Australian
gvt telecom folk told me that it's not at all easy to get silver
plating that really gives you better Q than polished copper.
Surface smoothness is apparently important, and IF you use silver
plated wire, be sure it's a very good coating of pure silver,
which is not what you get with most plating processes, according
to that source. As they say, "YMMV."

But 400 kHz (0.4 MHz) is only medium frequency (MF). Below that is low
frequency (LF) and below that is very low frequency (VLF), and finally
below that is extra low frequency (ELF). I understand that ultra low
frequencies (ULF) are informally considered to be freqs below 10 Hz.

How cheap is cheap ?
Not knowing the RF Parts price for copper plate, let me suggest
the following url.

http://www.communication-concepts.com/heat.htm

They offer 8x6x0.375 copper plate for $24 + $2 S/H.

They also have kits for 600 W and 1000 W MOSFET Linear amp kits.
They are the exact copy of Motorola Engineering Bulletine and Application
Notes. With only PCB and everything that goes on the board (including
the power FETs), 600 W version costs about $300, and 1000 W $1000.

The 1000 W version is virtually identical to the one Pieter has built.
But theirs (AR347) uses pair of MRF154 instead of MRF157 which Pieter used.

On the other hand, there is another company selling complete TR Linear amp kit.

http://users.aol.com/rfelectron/rfelect.htm

They sell 500W complete kit for under $400, 1000W kit for $720 without power
supply, of course. They employ 2SC2879s. 14 V PS required.

In general if an appropriate power supply can be built/found without much
cost/trouble, these isolid state amplifiers look very good.

I am looking into Pieter's webpage seriously for finding out other circutries
and parts such as T/R relays modules and control and display electronics, etc.
I hope he publish the complete detail so that a beginners like myself can
copy his implementation.

Let's talk more about it !!

Lee:
These type of devices can be used (with varying degees of sucess)
throughout
the HF range up to and including 6 meters. Yes (per W7EL) the performance
is affected by the gate-drain capacitance and will fall off above 10 MHz,
but I

still find use for them on 17,15,12 and 10 meters.
At 12 Volts DC, the IRF510 will put out 10 watts on 17 Meters, 6 watts on 10
meters at n~60% and n~50% respectively. They are extremely VSWR tolerant and do not fall prey to thermal runaway; problems that I experienced with RF bipolars.
Back in Dec 1986 I did an article for QST on using these devices[1] . The article concentrated on 80/40/30 meter operation with VFO. Since then, (and some >100 letters of excellent feedback later) the following changes occured:
1) the manufacturers have improved their process technology over several generations. I had used Generation 1 parts. Later generation MOSFETs were either faster, more robust or some of both.
2) Some readers used up to 24 volts to get 30 watts of output from these devices(IRF510!) . While then my intention then was to be compatible with direct +12 volts (car battery or gel cells) , but now its a "don't
care" because you can EASILY convert +12 volts up to whatever you want to use.
3) The earlier balanced doubler (on the VFO) using 2 transistors was replaced by a diode doubler/transistor amp. Easier to make, no adjustments.
(Big thanks to Zack W1VT for this).

All the above is with reference to Class C or D operation and obviously not fit for linear operation. But by applying proper bias, you should get useful
gain even up to 10 meters. The IRF510 types are not as high in power and current
ratings as the devices you mentioned, but could be easier to apply at HF. The higher Crss and Qt of the larger devices make them harder to drive than the
IRF510's. Also, the source lead inductance tends to be a factor, contributing some degeneration, reducing gain.
Let me know how you do. For 70 cents ,how can you go wrong!
Thanks and 73

4p7 is 4.7 pico farad,

1M5 is 1.5 Million ohm.

You treat the letter, which also gives you the power of ten, as a decimal point.

Harry.

All this is because Europeans speak various languages, and have
different conventions for numbers. One of the biggies is how
to represent a decimal point - do you use a period (.) or a
comma (,)? A convention like 4p7 avoids the issue - you can read
it as 4.7 pF or 4,7 pF, and everybody (even in Brussels :-) is
happy.

It's not just a Europe thing, either - Canada's two official languages
use different number conventions.

>incompatibilities.

No, the DUMB move was on IBM's part when they failed to re-arrange the
memory and I/O maps every couple months to keep reckless applications
programmers from directly accessing hardware. The peecee is a kluge
on top of kluge because of the supposed need to support "legacy" hardware
and software.

If things had been done correctly in the beginning, then programs written
for [brand]-DOS would have compiled to and run on any computer with
[brand]-DOS installed, no matter CPU or bus or ports. This would have
gotten programmers accustomed to the idea of going through OS calls to
get to the hardware and hardware designers accustomed to not selling
adapter cards without supplying low level (now kernel mode) drivers.
Then last generation's programmers wouldn't be grumpy and defiant about
the extra steps involved in working on a machine that is actually running
an operating system. They would have been on the cutting edge 15 years
ago and still be riding it today, instead of ducking from it.

>I'll never upgrade till they honor simple I/O and
>back-compatibility with old DOS programming and the vast DOS library of
>freeware.

Unless IBM releases a new version of DOS that supports the upcoming peecee
hardware (USB and PCI only--no antique ISA bus) they will be selling, there
will be no DOS-compatible peecees made by anybody. The computer most
popular in the world at this moment will--in a blinding flash--become about
as supported as the Amiga. Diehard DOS-heads are going to form user [luser?]
groups and a 1998 PentiumII ISA Win98 peecee will sit under a glass jar
between the Apple Lisa and the Commodore 64.

>And if they even think they can ditch all those programs they
>had better be prepared to rewrite and compile every good ap that a lot
>of folks like and give it away FREEE, and they sure won't want to do

>useful and obsolete little life for that reason!! This was ALSO why you
>discovered, to your dismay, that such a big concern as HP didn't give a
>shit about NT!!

If you want to take the easy way out, switch to NT; if you're a "real programmer," switch to linux (it's FREEEEE); if you're a has-been, keep using Win95 (aka DOS Shell on steroids (or is that Geritol?)).

BTW, to idiot peecee plug-in board manufacturers--if you refuse to supply NT drivers, you're surrendering to your competitors. There's an expensive IRIG card in my junk box that is useless because [brand] doesn't think they have the resourses to write NT drivers "for just a few customers" who want them. So I bought a new card specifically because they do supply NT drivers, and coincidentally, this new card is half-length and mostly SMT instead of the old card which was full-length and all through-hole. You can't just sit still or you will be destroyed! I strongly recommend that nobody buy stock in companies who build peecee boards but don't support NT. They won't be in business much longer.

Chris

Mike:

Thanks for sharing all of that, guess I have some research to do to
learn about some of these creative applications!

I am specifically interested in the "easy" conversion of 12 volts up,
especially at higher current levels. Could you share a little as to how
this may be done?

Thanks & 73, DavidC AA1FA

It's probably worth pointing out that this programmer only works for the 16F84, which uses flash memory. (And perhaps for the 16C84 with its EEPROM memory, I haven't looked). These can be programmed using the few available serial port lines because the parts are programmed using a serial data stream.

But most of the PIC microcontroller parts are EPROM or one-time programmable, and require parallel programming. For this, you need something that has some logic in it, and is either driven from the parallel port, or connects to the serial port and has a controller of some sort inside the programmer. These are bound to be more expensive.

For someone who just wants to experiment with microcontrollers in small numbers, building a $5 programmer and buying 16F84s is extremely attractive. For someone who wants to work with a wider range of PIC parts, someone else posted a source for a parallel-port programmer kit for $39 US - but you'll also need a UV eraser, so the total cost for using these other chips is considerably higher.

And this option is still far cheaper than Microchip's own PicStart Plus programmer, which seems to be about $200 US.

As a hobbyist, if I can buy some of the chips and have a programmer for $10 or $15, I'll do it without thinking about it. If it's going to cost $100-$150, I need a good reason. So the $5 programmer is most welcome.

Dave

I just got ahold of a copy of this article, and it looks liked pretty good. However, you talk about C15 and I cannot find it on the schematic nor in the parts list. What capacitor were you writing about in the article? Thanks.

>. . .

I believe the original question involved larger devices than the IRF510. I've been using an IRF510 at 12 volts in a 5 watt 20/15 meter rig for some years. It has reasonable efficiency (although the driver consumption starts becoming very noticeable on 15 meters), and is rugged and reasonably stable. I still feel that device capacitance might be a limiting factor for trying to use larger devices at higher power levels, at least with a 12 volt drain supply. Driver power dissipation might be more of a problem than output stage efficiency when using larger devices, or when using the IRF510 at higher frequencies.

What you are looking for sounds like a Synchron or similar small gearmotor.
They come in all kinds of final shaft speeds, and may be found in the Newark or
Allied catalog. Some surplus suppliers like Fair Radio or Marlin P. Jones also
stock them.

>It's not just a Europe thing, either - Canada's two official languages
>use different number conventions.
>
It's not only bureaucracy; there's also a good practical reason. As components get smaller and smaller, the decimal point/comma often disappears below the "quantum threshold" for printing.

For example, it becomes very hard to tell whether a capacitor with very faint or damaged printing is "4.7 p" or maybe "4 7 p" with wide spacing - but "4p7" is unambiguous.

You also see the same usages in European catalogs, for example:

4R7 = 4.7 ohms
0R47 or R47 = 0.47 ohms
220R = 220 ohms
1K0 = 1000 ohms
1M5 we already know about

4p7 we know
4n7 = 4.7nF = 4700pF
100n = 100nF = 100,000pF = 0.1 microfarads
0u1 = 0.1 microfarads too

4u7 in an RF choke = 4.7 microhenries
4m7 = 4.7 millihenries

Not true. Look at the data books (www.microchip.com). Only the baseline PIC's (16C54/55/56/57) require parallel programming. The midrange parts (12C5XX, 12C67X, 14CXXX, 16C5XX, 16C6X, 16C7X, 16C8X/F8X, 16C9XX) all use serial programming.

As I mentioned earlier, the MicroEngineering Labs EPIC controller programs most of the midrange PIC's. It is supposed to work with Windows NT, too, but I haven't tried this.

The circuit board that comes with the EPIC programmer is simple - probably about 10 dollars worth of parts. I imagine it is the software that is what they are making their money on. I still feel it is worth it for $50.

Many have written:
>>>[someone] point[ed] out that EE's, especially newer EEs, weren't
>>>really "with it" as far as practical experience?....

>>Yeah. A newly minted EE is pretty much a blank slate, ready to have
>>the practical matters not covered in his education transferred to him
>>by experience....

FWIW, the problem is NOT limited to EE's; I suspect it applies to most engineers and maybe even to anyone who has taken certain college courses which supposedly teach one something, but probably not something USEFUL. For example, most engineers have probably taken a course called "Statics", wherein they learn how to analyze forces and stresses on bridge structures (among other things). But they probably did NOT learn how to DESIGN, for example, the floor of a house or a strong shelf on the wall?

In order to design/build a new floor in an old barn, I recently started reading books with titles like "Wood Structure Design". Finally, almost in desperation, I talked to an (older) professor in our university's "construction science" program, and in less than 10 minutes he gave me enough "rules of thumb" and "how-to" suggestions that I was able to complete my design and even find typographical errors in equations in the books I was reading.

There's nothing like experience when it comes to the "real world"!

Incidentally, I'm a [retired] EE, but I knew about ham radio long before I went to college and got my first license my Freshman year. In a senior EE class, I was one of two students who knew how to wield a soldering iron!

VIVA LA HAM RADIO, even in its current and ever-changing configurations!

I am looking for a copy or a fax of the information about the "Blob" .
The "Blob" is a kit mod for the FT-101\XX radios. The mod was to add a

double balanced second mixer using an MC1496 IC to the receiver. I am
looking for the schematic as well as any notes.
The "Blob" was discussed in the 1972 issues of the Fox-Tango
newsletters. I have 1974 to 1978 newsletters that reference it but no
direct material describing the circuit used.
One or two pages is sufficient by fax or if you need to sell the whole
year....glad to pay for copying and mailing or will recropricate in
copying a sending what I have in the letters that you may need.

I wonder if ordinary white petroleum jelly (Vaseline) might help reduce
contact resistance at these frequencies without introducing additional
dielectric losses.

I use it often - at lower frequencies, I have measured a factor of ten
reduction in contact resistance.

I'd say with no regulation your single freq braodcasting is no longer in effect. Along with how wide your signal is. You already have the ant installed in your wall socket. The ground wire is what you want to plug into for a cheap ant. Just be sure to unplug any cared for vcr, computers, or other sensitive equipment in the whole house. If you hear your refrig talking you aren't the first. From what a ham buddy tells me your watts are limited by your size of ground wire. I've never used the gear but it would be fun. Like one of the other guys mentioned it's along the lines of spark gap. With broken microwave ovens being tossed you could have a 2KW transformer in one scrapping job. Hook 2 or 3 up together. Good luck. Jim AH6OY

4870. Dipping coaxial traps...

Source record: 76775

I've just completed building 2 coaxial traps (80 and 40m respectively).
One dipped at 3525, the
other at 7030 khz. However, after adding a 12" length of 12-gauge wire to
the each end of the traps,
they dipped below band by quite a bit. Question: Is this anything to worry
about? I cannot dis-
assemble the traps now that they are complete. Any thoughts?

Computer-controlled receivers such as the ICOM PCR-1000 can be
programmed with custom software to sweep any range of interest from
10KHz to 1.3Ghz and display the results on the computer screen.

The sweep would be somewhat slower, but wouldn't it otherwise give all
the information that the spectrum analyzer now gives if we used custom
software to normalize the sensitivity of the receiver over the range
and to automatically subtract the receiver's own internally generated
"birdies" from the display?

Hello:

I have an older Uniden two-way
radio that stores transmit and
receive frequencies plus PL tone
information on a channel-by-channel
basis in a 2732 EPROM.

The fellow who gave me the radio
programmed it to a bunch of the
local ham UHF repeaters in the
area with his employer's programmer,
and all was well.

Then I moved. Now all of the
programmed channels don't do
much good in the new area in which
I now live.

So now I want to be able to take
the EPROM out of the radio, "read"
the data in it, and hopefully be able
to figure out how to "change" the data
and write it back into the radio.

That being said, where is a good
place to find information on how
the data is stored (the actual bit
arrangement) inside a 27xx EPROM,
how to read data back "into" the
EPROM, what the difference is
between the Intel/Motorola/other
data formats is, which manufacturer
wants what kind of programming
voltages, and for how long, and all
of the OTHER stuff that I should
know about?

Or anything else?

Thanks, as always, for any
advice, help, "meaningful"
suggestions, or leads on where I
can find out of those "stand alone"

(no internal Pee Cee card/cable
required) EPROM reader/programmer
thingies that will work on the 2732.

You need a computer to edit the data, so why insist on a standalone
programmer? I have a free one on the WWW at http://www.zws.com/products/epromr2/

What puzzles me about your response is why you imagine that it's a "good thing" intrinsically that I/O programming be made as hard as possible instead of simply admitting where a port lies and always writing to that address. The plug-n-play stuff is cute, and it can take care of all the hardware difficulty you suggest with a simple user accessible handler without all the broo-haha of having the system overweeningly trying to tell everyone to waste time going through it for simple tasks. We have to read the equipment list now to know where the ports are, and accessing that sort of thing is simple enough. There is no need to make all kinds of the same port out of different dedicated hardware just to employ more idiot engineers! Alternatively one COULD have such a popular and simple to use universal device driverhandler to do this stuff that THAT would be well-entrenched as a hobbyists' friend! But then it strikes me that YOU might not like THAT EITHER, as then it would make things far too EASY for your liking! ;->

I get your point, but compatibility is the issue, and the current
architecture has become pandemic, which you might remind us describes a
disease, but I say that simplicity should be preserved within greater
capability and complexity!!
-Steve

I do NOT yet see that machine or system on the horizon ANYWHERE that
could bring that about for the ever-widening popularity of personal
computing. We already have DOS machines under glass, but note that
they will still run the same programs that are run on modern PC's! ;-)
That's a relatively new wrinkle in computing, portable software from
generation to generation! Sure, there have been emulators before in
software for using older software, but they were chiefly developer's
tools, and now they are popular and will likely remain so. We will
undoubtedly have two things inevitably in the NEXT generation of
personal computers:

1) It will run CP/M DOS and Win95/98 software seemlessly with its new
abilities.

2) It will allow the same hobbyist and small peripheral maker easy
I/O access for low-level add-on products, or it will not become
preeminent in the market and something else that DOES so WILL be!
This happened with CP/M to DOS (a parallel port that was I/O mapped and
usable) and now DOS to Win95/98!! It will occur again surely!!
That machine will outsell others as people see hobbyist friends do
tricks that THEIRS CAN'T DO, and they will covet that!!
-Steve

> >And if they even think they can ditch all those programs they

> programmer," switch to linux (it's FREEEEE); if you're a has-been, keep
> using Win95 (aka DOS Shell on steroids (or is that Geritol?)).

There will ALWAYS be an ongoing desire for:

1) Backward compatibility to keep the bastards from stealing all your money year after year with total replacement "upgrades" or else that computer and system won't BECOME OR REMAIN the ONE MOST POPULAR!!

2) Hardware that is accessible to CHEAP HOMEMADE DO_IT_YOURSELF ADD_ON peripherals for letting the common person be in touch and in control of his life, an ever-widening quest, and in the simplest and most easily taught and learned manner!

I predict that NO computer/system will become popular if those elements are NOT met!! Here's why!: NOTHING can by DEFINITION become popular and widespread if common people can't afford it easily, and that never happens UNLESS and UNTIL someone makes it CHEAP, CHEAP, CHEAP!!! If you made all the software impossible to copy you will be fucked by the market into GIVING it away, despite enormous development costs!! Vis Netscape Navigator and countless pieces of SO-CALLED shareware, (really FREEware!!!), which are now unfettered (means FREE to TAKE AND USE WITHOUT REAL LIMIT). The economic situation MAKES the low price reach that level!! And still, if you GIVE away something that the common person can't program and somebody ELSE gives away something that the common person CAN program, then the maker of the first something is fucked again! You can't charge for what people won't BUY!! They will only spend a certain amount of money. That means if you want to sell software you had better do it in a market where the computers to run it are CHEAP CHEAP CHEAP!! And if you make computers you will have to make them programmable to the common person, because WHEN, (Not IF but WHEN), someone else DOES, then you're fucked!! You can have 20 million sold, and you can still be dead in three years if someone puts out something BETTER!! My criteria above can be a working definition for what is "BETTER" , it's that simple! What CAN *SELL* *IS* what is BETTER!! This is because something that alleges to be better and doesn't sell doesn't exist!! (Not for long enough to piss on it anyway!)
-Steve

With the efforts of yours in the past I have seen on behalf of hobbyists
and those interested in HOW things work and in the public promulgation
of knowledge I would think that you would find my assertion laudable,
but you seem to have become an old foof about this stuff, or else an
embittered person who has retreated into elitism or business-oriented
conservatism-induced depression. Do you wish to simply make work for
programmers or what? I'd rather see everyone be able to use this
technology than have ANY sort of installed base of equipment exist that
the public cannot learn to use in a reasonable amount of their time!!
You puzzle me, Chris,
-Steve

Are SCA decoders unlawful in Canada? They used to sell kits to build them here in the U.S. of A. The hard part was finding FM stations whose sponsors were willing to divert station power into the subcarrier to provide it.

If the receiver has a good AGC, all signals above the AGC threshold would be about the same amplitude when the AGC is on, so you wouldn't have any amplitude information. A lot of modern receivers don't work well with the AGC off, but if it does, you could turn the AGC off. You'd then have to follow the receiver with a log amplifier to get a reasonable display dynamic range. If you left the AGC on, you could multiply the signal by the AGC voltage (by sampling the AGC voltage separately and doing a software multiplication, or by using an analog multiplier). This would generate only an approximately logarithmic display, so wouldn't be very accurate in terms of dB, but might produce a reasonable dynamic range. On the whole, a receiver doesn't sound like the best approach if you want a good dynamic range and reasonable amplitude measurement accuracy.

Roy Lewallen, W7EL

in answer to your question, a low pass filter in a transmitter circuit will suffice because the object is to suppress all freqs above the fundamenta {,harmonics are always above the fundamental}.in a rec circuit there are multiple unwanted signals present in the front end and must be either selected or suppressed . a band pass filter would work on the output of a transmitter but is more complex and does not add to the overall performance of the circuit .

I think it's easier, as an example, to call a standard set of functions
to set up and communicate through a serial port which don't care what
UART chip is used, or how many there are, or whether 4 of them are I/O
mapped and the other eight are memory mapped; than to "simply" write to
the UARTs directly through their ports. Talking to hardware directly is
the "hard as possible" way to do things, IMO.

>The plug-n-play stuff is cute, and it can take care of all the

>to read the equipment list now to know where the ports are, and
>accessing that sort of thing is simple enough.

I'd rather not know and not care what's on the other side of the port.
Thus, I don't care where it is, either. I've done interrupt-driven serial
I/O in x86 assy language on a PC. I'd rather call a function supplied
by the UART card manufacturer, NEEDLESS TO SAY. Suppose some application
needs 12 serial ports. Suppose further you need to talk to those 12 with
an application that can do serial comms. Do you want the DOS application
that knows of 4 and only 4 com ports that only have 2 interrupts among
them? Or do you want the Windows application that can talk to however
many com ports the OS tells the application there are? Booted to DOS 6,
my peecee has 2 com ports. Booted to NT, it has ten. I'm no champion of
M$ products--NT still has dastardly and evil "drive letters" which cause
me great hardship, particularly with the peecee BIOS and the OS arguing
about which drives should be assigned to which letters, or vice versa....
Frigging legacy crap.

>Alternatively one COULD have such a popular
>and simple to use universal device driverhandler to do this stuff that
>THAT would be well-entrenched as a hobbyists' friend! But then it
>strikes me that YOU might not like THAT EITHER, as then it would make
>things far too EASY for your liking! ;->

Well there actually are such things out there--considered "dangerous," but
useful nevertheless. I don't want OS's staying simple so I can use antique

rinky-dink compilers to talk to my homebuilt hardware. Instead I want brand new whammydyne compilers that don't suck--ones that make it really easy to write a kernel mode driver and accompanying DLL that makes my homebuilt card accessible not only to my application, but to any application.

The only thing that's missing now is a modern cross family p-code. So I can compile C to p-code, and then the OS compiles the p-code to the native machine language. Then I can literally drag and drop apps from a peecee to an Alpha workstation to a MIPS workstation, and maybe then to a handheld. With only dev drivers needing to be rewritten.

>That's a relatively new wrinkle in computing, portable software from
>generation to generation!

It's an idea that excites me, and goes along with the p-code idea. If not p-code then at least a wrapper around source code that compresses, protects by encryption, and allows one to build the application. E.g. an "Install Wizard" instead of merely unzipping the exectutables, it compiles using OS (or compiler manufacturer) calls to turn source into executable on the spot. But portable from generation to generation isn't a particularly new idea, that was the point of making Win95 allow api16 calls and at the same time include all the api16 calls in api32. Two paths of migration--win3 compatible execution or recompilation.

>We will
>undoubtedly have two things inevitably in the NEXT generation of
>personal computers:
>
>1) It will run CP/M DOS and Win95/98 software seemlessly with its new
>abilities.

It probably will still run CP/M,

>2) It will allow the same hobbyist and small peripheral maker easy
>I/O access for low-level add-on products, or it will not become
>preeminent in the market and something else that DOES so WILL be!

Malarkey! It won't have an ISA bus. The generation after next won't even have a printer port. Nobody cares about "easy I/O access" because any card that's got any chance in the marketplace comes with drivers. I don't ever want to learn how to program the the PCI bus. If I'm going to do any hardware hacking, it's either going to be using commercial I/O cards, or with USB-conversant microcontrollers. Fact of life. But I'm not going to get rid of my old PC, either--it will be networked to my next gen PC. Just gotta hope NT 5 talks to NetWare.

>1) Backward compatibility to keep the bastards from stealing all your
>money year after year with total replacement "upgrades" or else that
>computer and system won't BECOME OR REMAIN the ONE MOST POPULAR!!

I upgrade because it's worth it, not because somebody's forced me to. They're not stealing from me, they're giving me what I want! More

megahertz! More gigabytes! (Or do you call 'em bevabytes?)

>2) Hardware that is accessible to CHEAP HOMEMADE DO_IT_YOURSELF ADD_ON
>peripherals for letting the common person be in touch and in control
>of his life, an ever-widening quest, and in the simplest and most easily
>taught and learned manner!

I need good development tools that make I/O programming easy--not
inherently easy I/O. The best way to make add on peripherals is with
standard external comms like the Apple desktop bus, or USB, or whatever
comes next. The hard part is getting hold of the necessary
microcontrollers in small qtys and big packages.

>With the efforts of yours in the past I have seen on behalf of hobbyists
>and those interested in HOW things work and in the public promulgation
>of knowledge I would think that you would find my assertion laudable,
>but you seem to have become an old foof about this stuff, or else an
>embittered person who has retreated into elitism or business-oriented
>conservatism-induced depression.

Bah. I just refuse to cling to the obsolete. Why fiddle around hooking
up an LCD with 11 wires when you can plug on Scott Edwards' Backpack and
hook it up with 1 wire? Why use an easy-to-understand scrubboard to do
laundry when I've got a fancy white cube that does it faster and better
while I read the latest issue of Circuit Cellar INK?

BTW, is there a newsgroup better suited for a discussion like this? Like
comp.flame.cranky-old-hackers?

Regards,
Chris

Hmmm ... There's what's easy, and there's what's possible. I'm not a Microsoft basher (Word and Excel are two of the best programs I've yet seen). But an OS that may be great for checkbook balancing programs my not be so good for real time applications that have to be FAST and/or applications that interact with external devices.

I've done a several things with serial ports, both in a "normal" mode and just using the lines for control, bit fiddling or whatever.

I got Visual Basic thinking I'd get out of the stone age of assembly language and into the modern world. I was a little shocked to see it didn't offer any serial port access. But the included 3rd party vendor literature pointed me to a place that had an add-on for serial port access. So now I've got it made. But no, the add-on only gives access to the "popular" lines such as RTS, CTS, not every line. Never mind that when you read the status register, you've got all lines in the 8 bits; the application developer decided what lines the user might need to see and which ones he wouldn't be allowed to see. It's that partonizing, "ah ah, don't touch!!" attitude toward programmers that makes trying to work in the Windows world so maddening.

> Well there actually are such things out there--considered "dangerous," but
> useful nevertheless.

You've encapsulated the attitude perfectly there. Don't try to program anything yourself, it's dangerous. Don't use the hardware. Write your Word macros and be happy. This trend is death to the individual hobbyist/experimenter.

> Bah. I just refuse to cling to the obsolete. Why fiddle around hooking

You're talking out of both sides or your mouth here. First you say the modern systems WILL do what experimenters want to do, then you say they won't but why bother rolling your own when you can run out and buy the latest appliance. And your washing machine analogy is perfect. As the home computer becomes more and more a sealed white appliance, it's promise as a virtual machine that the knowledgeable user can experiment with goes away.

Thats great if the "standard" set of functions actually is standard
are documented, and work as specified. Windows's version is a
ridiculous mess, but they sort of work. Unix's are better, but neither
are a complete answer. Sometimes nothing other than hardware access
will do, and a well-designed operating system should allow you to-
if you choose.

Well, the 4 com port limitation is due to the poorly designed PC bios and
architecture. Under DOS, you'd never use the BIOS for comms anyhow, so
you are stuck with comms libraries and/or hardware access- no suprise
there.. Many multiport comm boards exist for dos- not much problem there
either.

Even under Microsoft, theres no convienent way for a program to find out how many
comm ports are in your system- the old way of opening them until one fails
fails is easiest- but not a good solution. Under Unix, all you need to do
is a directory listing- no problem. If you want to see a real mess, look at
the MAPI or TAPI interface.

I agree about the drive letters however.

In my opinion, the operating system should give you the level of abstraction
YOU desire- even if that is no abstraction whatsoever. I prefer simple things,
software is so complex already, tried and true solutions are sometimes preferable
to fancy new ones- the Fallacy of Novelty is almost intrinsic in computer tech...

Ahh, the Holy Grail. Yawn. I'd rather have open, rigorously defined
source standards and compilers for them to tailor for each architecture.
It seems to me p-code and workalikes end up preserving inefficiencies
where a smart compiler can optimize the executable for its environment.

Win16 to Win32 is nothing to brag about- that API has been a mess since
its creation and it keeps getting worse. ANSI C is a much more
disciplined and widely supported API.

That is if NT 5 is actually ever released. Even if mboard people drop the
port, there are lots of expansion cards that work just fine. Who cares
about USB anyway? I like open stable standards, not fancy complicated drivers.

But some of us like low level stuff- working with low level software
on top of hardware you built yourself is very instructive and a lot of
fun. Even in DOS 6 using Qbasic to talk to a 8051 or PIC is extremely
valuable with respect to teaching about interfacing techniques and pitfalls.

The Backpack is fine in its place, but what if you want something like a 240x64 LCD panel hooked to your Ucontrollers address bus so you can figure out how to draw lines and do your own page flipping and bitmaps in assembly?

Sure, you can buy a gizmo to do it for you, but that won't teach you the low level stuff. If you don't want to learn that, fine, but please consider others who do. Further, older is not necessarily obsolete- my dad uses 2 Atari 800s to run his seismograph and perform Fourier analyses on the data. Obsolete? Likely- BUT it works and does the job.

Could someone enlighten me as to what exactly *is* a radio dog fence?

I'm in England - we don't get these gadgets here. I get the idea it
transmits a bunch of radio interference all up the SW bands, but how
does this help training dogs?

> Pour rï¿½pondre par e-mail, remplacez "nospam" par "rsm6"

Essentially, you surround an area you want "fenced" with a buried loop antenna. A low-power transmitter feeds the loop at around 10 to 30 kHz. Your dog(s) wear a collar equipped with a lightweight, battery-powered receiver and two electrodes in contact with the neck.

The collar sounds a "beep" whenever the dog approaches the buried boundary wire. The owner, at least in theory, trains the dog to avoid the warning by repeatedly walking the dog up next to the boundary and pulling it back when the beep sounds. (The boundary is also marked with small flags at regular intervals.)

Once the dog is trained to respect the boundary, the flags can be removed. In the future, if the dog ever disregards the warning beep and continues to approach the boundary, a shock is administered by the collar as a deterrent.

How well this all works in practice depends on the owner's willingness to work patiently with the dog in the training phase. One unquestionably-good use of the radio fence is to break your dog of the habit of digging under your real fence!

The problem people seem to be having is that because the transmitter's waveform is non-sinusoidal, the loop ends up radiating harmonics all over the place. The obvious solution would be a low-pass filter installed in each leg of the (balanced) loop.

man you ask allot...

many programmers can read as well as write but thats the leest of your problems. chances are the program as well as the repeater info are stored in the same eprom, making it impossible to understand without souce code. this is very likely if there is only one eprom in there...

4904. Radio dog fence - "slightly off topic"

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-20 00:00:00 UTC
From: rice@ironbark.bendigo.latrobe.edu.au
Message-ID: <rice-ya02408000R2011981013510001@news.latrobe.edu.au>
Source record: 76663

Maybe off topic, but it gives me a chuckle now & then.

Our "new" dog (second hand actually) used to take great delight in destroying out potted plants (both the plants & the pots).

I built an electric fence from the line output stage of a defunct terminal, powered by a weak 12 volt dc power supply (I didn't want to kill the dog, just give the plants a small chance to defend themselves). After receiving a few jolts, the dog left the plants alone - which was the intended outcome.

Some time later, I extended the fence to protect a part of the garden that was getting worn out with doggie foot traffic. The dog watched me install the fence, barking all the time. I needn't have connected any high voltage to the wire as the dog wouldn't go near it.

Now I am the one getting the most shocks off the fence (whenever I do a bit of gardening) - the dog just keeps out of the way. He doesn't seem to be traumatised by the fence - he will now go near it but won't touch it or the plants.

Some examples of "easy" DC-DC Converters might be Maxim MAX1771
but some design work might be needed to get say 20-24 volts at 2 amps.
Since it uses an external transistor and diode, it looks feasible.

This is true... the P.A.E. does fall off as you go up to 30 MHz with the
IRF510 (also IRF520 series).
I would like to compare some of the more recent vintage (IRF510
Generation 3 process or better) verses my old IRF510's that were made by
the (now defunct)
General Instrument component group. The older parts yield 10 W at 18 MHz/
6 W at 30 MHz.
Roy, there's hope on the horizon! If Motorola (Ericsson,Polyfet etc)
stick with
it , we may yet see LDMOS plastic at nice cheap prices. The MRF1508 looks
super and is easy on the wallet ! Have you tried any of these devices?

Now that is a strange thing, a dielectric reducing resistance.
I used to apply a little Three-in-one oil to the rails of the 00 gauge
it stopped sparking and improved the start up of the loco.
The problem was that the resins eventually thickened and stuck
dust to the rails. So a regular maintenance job was to clean and
replace the oil.
I have never investigated this phenomenon properly with
instrumentation and now I don't have a properly equipped lab to do so.

I have only ever used tuning screws completely dry.

I expect that because the oil changes over time that the device may
not be long term stable.

A good lock nut lightly nipped up will draw the threads together
and improve stability and initially contact resistance.

When metals are in close proximity for some time small crystals
grow between the surfaces which improve the contact resistance.
This phenomenon may be observed with pre-set pots.
If left alone they soldier on for years.
Once adjusted they become unstable and noisy until new
crystals grow.

This is one reason that I would prefer to leave a pot that is only very slightly out of adjustment alone.

If it ain't broke, don't fix it.

Actually, it is a hydrocarbon. It helps clean oxides and gunk off the
metal surfaces and leaves a film that prevents oxidation.

The microscopic asperites in the metal surface punch through the film,
allowing true metal-to-metal contact. This has much lower resistance than
dirty contacts.

I have a short blurb on my web page on reducing modem errors:

http://www.csolve.net/~add/system/modemtip.htm

> I used to apply a little Three-in-one oil to the rails of the 00 gauge
> it stopped sparking and improved the start up of the loco.

See - same idea. A true metallic contact has lower resistance.

> The problem was that the resins eventually thickened and stuck
> dust to the rails. So a regular maintenance job was to clean and
> replace the oil.

I don't think vaseline would be appropriate in this application.

> I have never investigated this phenomenon properly with
> instrumentation and now I don't have a properly equipped lab to do so.
>
> I have only ever used tuning screws completely dry.

My experience also, but a long time ago. I didn't know about using
vaseline to help contacts then.

> I expect that because the oil changes over time that the device may
> not be long term stable.

It depends on temperature. For room temperature, it remains effective for several years. Outside, or around your car, it only lasts through one summer. The heat melts it and it slides away.

> A good lock nut lightly nipped up will draw the threads together
> and improve stability and initially contact resistance.
>
> When metals are in close proximity for some time small crystals

I think the telephone company suffered from these whiskers on relay contacts for some time. I'm not sure they make a low-resistance contact.

> This phenomenon may be observed with pre-set pots.
> If left alone they soldier on for years.
> Once adjusted they become unstable and noisy until new

Pots are a metal to carbon interface. I haven't seen a pot "repair" itself when it gets noisy. It usually needs a shot of WD-40 to clean the gunk out.

: that may be great for checkbook balancing programs my not be so good for real
: time applications that have to be FAST and/or applications that interact with
: external devices.

If you need _predictable_ response times below 1 ms on NT, you need to
install some third party real time kernel, which runs the Windows NT
operating system as one low priority real time task.

Back to this discussion about EPROM/PIC programmers.

The MS-DOS is a small cute collection of usable routines (and I would
even go so far as labelling them as BIOS extensions) that helps
writing applications that have full control over the hardware. This
single stream environment is very badly suited for coexistence with
other programs in a multitasking environment. The attempt to match
these wildly different environment have caused such bad compromises as
Win 3.x, Win95/98, in which the application program is not in full
control, but neither does it run multiple processes very well. The
WinNT does not even attempt to give the illusion of full control to
the MS-DOS application.

With the nonexistent or minimal cost of MS-DOS capable computers on
the surplus market, I wonder why anybody would attempt to connect
these hobby EPROM programming cards to their main computer and
complain that the operating system does not support it. Just get a
surplus MS-DOS machine, attach the programmer card to it and connect
the MS-DOS machine to your main computer. This connection could be
through the LAN, redirecting the MS-DOS to the serial port and using a
terminal emulator on your main computer. Or just switch the monitor
and keyboard between the computers and use floppy file transfer or
even use separate monitors and keyboards.

In such environments you can do all the editing and compilation in
your main machine and download it to the MS-DOS machine for execution.
The only problem with this approach is that the surplus computers tend
to be bulky and sometimes noisy, so you have to spend some time
selecting a suitable surplus computer.

Any surplus running around inside a Waveguide or filter cavity might not be
a good idea. On the walls it wouldn't do much, (I found anodised aluminium
guide performed better than plain), but in the centre on vanes or what ever
the change in dielectric constant would change lambda g a bit and probably
detune any resonant structures. What it might do for the 'Q' of a cavity I
can not say.
At one stage in my life we only had Klystrons as local oscillators. In order
to improve the frequency stability we used a Pound Stabiliser. The cavity
used as the reference was turned from Oxygen free high conductivity Copper
(OFHC Cu).
The wall thickness was about a quarter inch and the internal diameter about
3 inches. The cavity was polished with jewellers rouge and the Q measured.
Polishing was continued until the required Q of around 18,000 was achieved.
Then the cavity was filled with dry nitrogen to prevent oxides from forming
and spoiling the Q in service. Some times the polishing and measuring could
go on for several hours. Amazing how well results were achieved with the
crude old kit we had in those days.

A relay is a different case. the crystals only help with static contacts
where a virtual weld forms.

I wouldn't recommend WD-40 for pots it becomes very sticky in a very short
time. There are better agents, (technician in a can), electrolube. etc.

No, my experimentation with power FETs so far is limited to the IRF510. (To be truthful, I'm really using an IRF511, which isn't quite as good for 12 volt operation, but it's what I had on hand.)

I know Motorola makes some power FETs for RF amplifier use, and think they have considerably lower capacitance for a given on resistance as compared with the conventional power FETs like the IRF510. But I also was under the impression they're relatively expensive and not as easy to get hold of as IRF510s. I assume the MRF1508 is a Motorola part, but it's not in my 1994 RF Device Data catalog (time to update!). I'll certainly be interested in the results of any experiments. What do they cost, and are they fairly available?

I think the real solution for using conventional power FETs is what others have posted here -- raise Vdd to 24 volts. That way, you can get by with a higher on resistance/lower capacitance part. (I'm interested only in CW, but understand that the higher Vdd also significantly improves the linearity of SSB amplifiers.) I want my rigs to run from 12 volts and so far I've been too lazy to whip up a switching converter, but one of these days. . .

You may be able to satisfy all of your Motorola semiconductor data needs
at http://sps.motorola.com/ - they also have a price book online which
may give an idea of the MSRP, but you have to order things like the RF power
FETs from Halmark or Wyle.

Which is reasonably trivial with something a TL494 regulator, a power
MOSFET (perhaps even the same one you use in the RF PA) and a high-speed
diode (I scored a huge bag of UES1402s at a swap meet, they're ideal
for this kind of project). Just make sure to allow for strobing the
converter off during receive to reduce the RFI, though this may not
be practical in a QSK design.

One such converter I built produced 25V @ 1A, with better than 90%
efficiency. A single bolt-on heatink for both the FET and diode
(in TO-220 packages) was more than adequate.

You don't ever want a user program to be able to directly access hardware.
That's an invitation for trouble. It'll screw up multitasking, it'll cause conflicts
that can lock the machine, cause disk and file corruption, etc. The machine
hardware should be accessable only via kernel calls. That way the OS can
do its job of managing the machine's resources properly. Any competent
OS (Linux) does this, program loaders (CP/M, DOS), and program loaders
with a GUI tacked on top (Windoze), don't do this properly. Nice Try comes
close to being an OS, but doesn't make the cut in my opinion because it
is such a bloated kitchen sink kludge that it does nothing well.

That's what Java is supposed to offer (it isn't quite there yet). You can run a Java app's p code in a Java virtual machine on your target system, or you can use JIT compilation to get native speed out of it. Java isn't a very good system programmer's language (IMHO), but it does quite well for user programs.

>and to automatically subtract the receiver's own internally generated
>"birdies" from the display?

That sort of works. Some of the problems are, the sweep winds up being
very slow, several tens of milliseconds per step, and there isn't a good
selection of bandwidths available (the choices are either too narrow for
full span sweeps or too wide for close in sweeps). OTOH, the RSSI is
available, and can be calibrated in software. Baseband demodulation is
also available, and can be fed to a sound card for analysis by the PC. The
latter can allow high resolution over narrow spans.

But the lack of wide bandwidth filters, and the lack of rapid stepping, so
you can do large span sweeps in a reasonable amount of time, are the real
killers for using the PCR1000 this way. That, and the fact that Icom refuses
to release the command codes for the receiver, and that errant commands
can trash the EEPROM in the radio, requiring it to go back to Icom for service,
are the fatal flaws of this receiver.

If they'd had the sense to put a write protect service jumper inside the radio,
this wouldn't have been a problem. (The FCC probably wouldn't have withdrawn
certification for the radio either, IE you can write one byte to the EEPROM and
open up cellular coverage without ever taking screwdriver to the radio, the FCC
doesn't like that.) Icom seems to be dumping the units already in the country at
a sharp discount, so if you want one, now is the time. You *can* add your own write
protect service jumper inside with one trace cut and one resistor. That makes it
immune to having the EEPROM trashed by errant software. With that fix, it is
a pretty neat little receiver when used with third party software (Icom's software
reeks).

Take a 1/4-wave whip and bend it over so that the tip is almost on the same level as the base, and operate it close to Earth (a few feet above ground). This gives you a NVIS pattern. This is commonly seen on military vehicles. Alternately, you can just use a low horizontal dipole (simpler and cheaper for fixed use, especially on the lower frequencies where NVIS is normally used).

The problem as I remember was Tin plated components inside sealed crystal
filter
cans. The tin would grow whiskers and short out. A repair was to put high
voltage
on certain pins and burn the wiskers.

But the point remains that sometimes hardware level access is indicated.
But it doesn't bother me too much to require such access be carefully
regulated- not through a monolithic super-abstract API, but possibly a
tweak to the kernel or a small device driver. Not all hardware access
will interfere with multitasking- at the very least the resource in use
could be mutexed by the OS.

How does bending the 1/4 whip over affect it's impediance? Also, what
(approximately) is a NVIS pattern (what is the acronym?)?

How much of a factor is the height of a dipole on how it radiates? I'm
interested in doing some 40m work with a not-quite-right dipole (with a
transmatch-aproximately 55-60 feet of wire) with just a few watts,
mostly for around town work, and maybe later on for across the state.
But, the dipole is planned to go into my attic--the attic is on the 3rd
story of my house. Should I plan to put it up outside, for around town
stuff (which would give the added benifit of being cut to the right
freq)? Thanks.

A receiver IF filter has an ideal rectangular bandpass characteristic (low ratio shape factor).
The requirements for spectrum analyzer filters are different. Attempting a rapid sweep
using normal receiver filters would cause severe attenuation and distortion of the received
signals.

QTH.NET has established a Amateur Radio PIC Microcontroller email
reflector. It's open for business. Those interested in discussing PIC
microcontrollers and their use in Amateur Radio please do join us. To
subscribe send email to:

majordomo@qth.net
Leave the subject line blank. In the body of the message type:

subscribe ham-pic

Leave the rest of the message blank. You will receive a confirmation email
with further instructions followed by an introductory email with the rules
of the list and instructions for posting to the list and unsubscribing etc.
Please read these carefully and save the latter for future reference.

Please forward this message to other Hams you know that are working with
and/or interested in learning about PIC microcontrollers and applications
for our hobby.

Thanks and 73 de KA0GKC Claton Cadmus

Yes...if you could use a TV cable switch, it'd be really cheap...only watch port-to-port isolation if you're using it for a TX-RX switch.

I disagree to an extent with the philosophy that *all* hardware should be inaccessible to application tasks. Some hardware is simply only usable by certain apps, and a good OS should be able to grant direct exclusive access to that hardware to an appropriate task. (Note that a sometimes-good compromise is the concept of add-on and/or replaceable OS drivers.)

One concept that is completely lost on modern OS designers is that when the OS obstructs the application from legitimately doing real work, it is contradicting its reason for existing. Over the years I've fought with all too many kernels and OSes in the attempt to get them to perform an action in under one second, or for that matter perform it at all (e.g. toggle DTR).

The real pity, though, is that the OS deities who are so insistent that only they can provide proper access to hardware seem unable to write code that takes less than 100K instructions to load a value into a register. Then they act insulted when we mere mortals aren't satisfied with their beautifully structured and highly complex code, look down their noses and declare that it's *our* fault for not having terahertz processors with exabytes of memory.

Yes Phil
dogs are smart!!! Much more than we sometimes give them credit for!
Having a collar type system, would not take long for an ordinary
street smart doggie to find out with collar - shock, no collar - great
fun!!!

Most sheepdogs learn the hard way to keep out of the electrical fences
that keeps the cows and sheeps in place. The dogs learn to jump over
or crawl under.

The question remains, do the user of these things *really* need them
or are they just too lazy to train the dog in a more "humane" way??

Cheers

>that is in matters chemical. I am always eager to learn.

Petroleum jelly (Vaseline) is essentially a nonpolar, long-chained alkane. Its molecular weight is generally lower than paraffin wax and far less than polyethylene, but the atomic structure is similar. It has a very low loss tangent through at least the normal microwave region. I do not know its properties at millimeter wavelengths, but it will certainly show infrared spectra. Offhand, I do not remember its dielectric constant, but I think it is around 3 to 4.

When making dielectric measurements of polymer films in a parallel plate (GenRad) sample holder, it was common to use very small amounts to fill in the void spaces and bubbles between the polymer surface and the electrodes. The error introduced was extremely small unless samples were being measured with an exceptionally high dielectric constant.

Source record: 76609

Hello,

I can't seem to find specs for the following tube
7943, BT145A, TQ2/3 (types printed on the tube)
I have tried all 'web based tube databases.

It has 4 pin base with 2*filament, 1*NC, 1*something
and a anode cap. It might be a triode but the
configuration of innards looks strange.

The local army surplus store has these for a really
reasonable price, if they are something usable.

Thanks,

Kristian.

>direct material describing the circuit used.

Haven't seen the Fox-Tango article, but believe G3VA mentioned the
circuit in his column in Radcom in 1979-80. The modification is hardly a
modification, since - as W7ZOI puts it - MC1496P has an intercept point
of -20dBm (or less?).

I bought an FT-101B for the purpose of modifying it, but first of all I
wanted to have good agc operation, without it the receiver was not worth
much. After tremendous amount of tries to improve the agc I discovered
that agc could simply not be improved because of VERY high leakage from
BFO into the early stage of IF, you need no connection between the BFO
and product detector, but reads ssb just as good. Same problem with
FT-221/225, made after the same mechanical principles

So I discarded the rig, throw it into the waist and the rubbish was
collected on the following tuesday..... almost 20 years ago

: exabytes of memory.

This is a question of sensible division of labour.

If you implement the control of a bare bone EPROMer by a very simple
kernel mode driver that just gets one value and write it to a register
and do all the other operations to burn a single byte in the
application level, then sure, it going to take a terahertz processor.

If however, put a little more intelligence into that kernel mode
driver, you supply a higher level command such as "burn the following
n bytes starting from aaaa, the data is xxxxxx" and send this to the
kernel mode driver. At each interrupt, the kernel mode driver loads
the next byte to be burned from the kernel mode buffer to the device
registers. The CPU power requirement is greatly reduced by this.

In the kernel mode driver you can do whatever you like, but if you do
not know what you are doing, the most common result will be that the
system will crash.

There is NOTHING wrong with allowing an individual superuser, root/admin
of that machine, to access the hardware at will, simply, because they
don't abuse the privilege by trying to have two tasks try to screw with
the hardware at the same time in a way that will fail catastrophically!!

It isn't necessary to totally PRECLUDE that in the OS for the root user!! This access can even be important to debugging! And MOST people using a computer are using it ALONE THEMSELVES for a number of tasks at once, or even a single task!! Multitasking's limitations for multiple users should NOT be enforced on individual owner/users!!

That's STUPID!! I can still make my Win95 machine from WINDOWS run a

handcoded in hex DEBUG file and name it SHITHEAD.COM file that sends
a byte to the parallel port or all unused address ranges!! For
owner/root-users of these machines such crap is unnecesary and
unwanted!! People won't and shouldn't BUY this horseshit!!

You have summed up the situation perfectly. I'd be happy to use the newest
OS if it would:

1. Let me do what I need to do and,
2. Do it today.

I'm not writing a checkbook balancing program. I need to read the RI line,
right now!

<snip>

Thanks for all your replies - I am enlightened now. I was surprised to find they *do* sell them in England, I thought we were an animal loving nation! [With the exception of certain police forces and courts who sentence a dog to be put down for *barking* at a post man [the dog was acquitted]]

Whatever happened to "sit, stay and walkies?" Thank goodness I only have cats, who do not bother my radio work unless they get in the shack and pull at cables [and they are soon shooed out if they do...]

I wouldn't be surprised though if eventually both the DTI [==FCC,PTT in other countries] and the RSPCA[==Humane Society] call for these execrable devices to be banned!

And precisely for that feature I do not consider the Win95 for any
serious usage.

On the other hand trying to do anything time critical hardware access
under Win 3.x or Win95 will sooner or later fail due to the
unpredictability of the multitasking scheduling. The Win 3.x and Win95
are compromises that neither give full control nor good multitasking
and protection. In fact the requirements are so different that I doubt
a good compromise can be made.

As I suggested in a previous post, use a computer with good
multitasking (such as NT or Linux) for routine operations and when you
require direct hardware control (and do not want to write a proper
driver) use a surplus PC running plain old MS-DOS, which will give you
full control over the hardware and network these machines together.

Hello,

I just completed building a Rainbow Kit wideband amp to use with my frequency counter. It's the one on sale this month for $9.95 at Tech America..... Rainbow Model WBA-6. First time I ever soldered surface mount components but it went together ok and seems to work far as I can tell. They recommend putting the board in a "wrap around brass enclosure"..... anyone know where I can get one of these ? Or have any suggestions on a suitable enclosure or experience with this kit ?

>>Vaseline at uW frequencies?
>There shouldn't be enough of it to matter.

Mind over matter.
If you don't mind I don't matter ;)

Actually I was thinking in general terms.
I have a table of physical properties of various materials on my machine
which I add to on an opportunity basis.
It started off as a copy of the table in the 1966 Microwave Engineers
Handbook.
Over a period of time I have add materials as the data has become available.
It does come in useful from time to time. :)

Vaseline / Petroleum Jelly seems to be absent from the table.
If I can get the density/SG Dielectric constant Loss tan, resistivity,
boiling point etc. whatever it is ready there next time I'm playing around
with a speculative design.
The idea is to have it along with all of the physical constants as a starter
spread sheet page.
When starting up a new project I simply load this workbook rename and save
it then away I go.

I can write an equation such as =k*(To-Tn) * df
and most of the constants are already potted into the new spread sheet the
savings start up time and the reduction of errors is worth the effort of
maintaining the sheet of physical data.
Eventually I hope to have a complete periodic table with trimmings etc.
I might never use some of the data, but it could be useful to others.
It is one of those projects that never seems to end.

Brian, it really depends on what you want to do, a tech license gives you quite a number of operating privileges. Are you interested in learning code? Sending CW? Are you interested in working DX? or just running 2 or 6m FM? Tell us about your operating interests and you'll get plenty of good advise.

Good point. However, if the parallel port is shared among concurrent tasks it becomes important for none of them to write directly to the port but rather through a system call that provides mutual exclusive access.

Any one know What the requirements of a FM Broadcast station are
for harmonic generation?

I am trying to help a radio station determine if their Ninth Harmonic
is causing unlawful interference.
What filters are available?
What are the levels required in db down off the main carrier?
What are the possible methods and tools to determine if it may be
a bad connection on the transmitter tower?

Thanks,]

>way to trim a trap antenna?

Hello,

AC6I's comments are right on the money, so I won't repeat them, just add my support. Here are some additional ideas:

1) Ten years in the weather may have done some funny things to the coax, balun, and/or traps. The SWR meter may be screwy, too. The 4.6 MHz SWR check may or may not be proof that the coax and balun are good.

2) Coax traps give different results if reversed. I always use mine "with the center conductor end towards the center of the antenna (feed point)". If a trap gets turned around, or they are not both installed the same way, the results are VERY confusing!

3) You obviously have some method of reading SWR outside the ham bands, so I'd suggest putting the antenna up with wires you know are too long (35 foot 40

meter sections, and 25 foot 80 meter sections), then doing an SWR reading every 100 kHz or so, looking for the dips. Then you shorten a little at a time to move the dip into the band.

4) Although the traps may dip at the right frequency, their Q may have degraded over time. A bad trap will drive you loco. Coax cable traps are so cheap (I use RG-58 and "2 inch" PVC pipe) and figure each one costs me less than $2. So if there is any doubt, I just replace them. For weatherproofing, I use clear Krylon spray on the outside, and bathtub caulk on the connections inside.

5) To avoid the grief of splicing and re-splicing, get some "split bolt connectors" that are used in the electrical trades. Also called "bugs" or "Burndys", they consist of a bronze bolt and nut. The nut has a slot cut longitudinally right through it. You put the wires to be spliced in the slot and then put on the nut, and tighten. Two of them will make a splice that can be easily opened and adjusted. After finding the right length, you can make your splices the conventional way and put the "bugs" away for the next time. I wouldn't trust that kind of connection in a permanent antenna system, though.

I've used an 80/40 inverted V with coaxial cable traps a la N4UU for almost 15 years. Never a problem - once I learned all of the above.

Well, "core" unit doesn't tell us much, but here's my suggestion. If you have little or no experience building, but really want to build something then I'd suggest looking at the Ten Tec 2m FM rig if you think your going to want to work 2m FM. If you want to start out like most of us did in the 'old days' working HF on CW then take a look at a small inexpensive CW rig, the prices range from $50 for a 1 watt CW rig to several hundred dollars for a multiband rig. You'll be stunned and amazed how many contacts can be had with very little power. Most of these kits are straight forward but you may need to find a ham friend with a reciever to help calibrate the VFO and make sure your in the ham bands. I am working on 2 rigs right now, one for 40 and one for 30m I'm building from scratch but I would not encourage you to do that since 90% of scratch building is tracking down and ordering hard to find parts and unless you have an extensive junk box it can be time consuming and possibly discouraging for your first build.. Get a kit that's complete. Go take a look at the kit manufactures from the link below, you should find plenty to choose from. Good Luck.

Paul, it's just NOT the cost so much as the annoyance and HAVING to
have another computer laying around when you already have one really
nice one!! What you suggest is simply pig-shit stupid!! Multitasking
restrictions are a wonderful thing when needed, but a solitary user
doesn't need that!! And the VAST majority of computer users are
solitary users!! It's alright to make them invoke a special system
enable to let them lock a port to an application for instance whenever a
DOSBOX is even RUN!! But it has to be SIMPLE! Just KEEP IT SIMPLE,
(STUPID)!

FINE, then simply have the sysyem invoke mutually exclusive access for
ANY DOSbox that is opened, and lock any ports it calls to that app!
Then have it reinvoke multitasking system restrictions when that task is
terminated. Keep It Simple (Stupid)!

Brian,

Once you have the Morse alphabet memorized, it is hard to beat listening to other hams and the W1AW code practice broadcasts. The novice subbands always have lots of slow speed QSOs going. Of course, you'll need a HF receiver.

Alex, I guess you missed a lot of what I was trying to imply in my post,
which is that these devices are NOT "inhumane" in and of themselves. If
you work with the dog properly (per the manufacturer's instructions),
there is no reason why the dog should ever actually receive the shock
more than once or twice at the most (if at all).

As usual, it's the owner's responsibility to provide the "humane-ness",

Steve, IMHO it does do that, try using a COM port when a DOS program has the port open. The issue is that the OS needs to know that the port is in use to do it autiomatically. That means that it needs to hids the hardware in some way, like NT does, so that any attempt to access hardware will inform the OS (as with NT).

That leads to the problem of valid accesses vs. mistakes, you don't want a bug that generated a write to a port to lock that port as long as the app is running, especially if it is a commonly used port (like the LPT port). Either you add OS calls for the app to request the port, or you provide a "virtual" port like NT.

The virtual port can only handle operations it has been programmed to emulate, so the virtual NT LPT port only handles printing functions, not the bit twiddling needed to communicate bidirectionally.

The problem is that any DOS app that goes directly to hardware either won't make the OS call to reserve the resource (since it doesn't know how) or tries to do fancy footwork with the bits (the port was not intended to be bidirectional, even if you can do it). For old apps this is understandable.

If you insist on writing programs that do it, however, that's just shortsighted. Spend a little tine writing a good VXD for NT (and 95/98) and use that, it may not be truly portable but it is smarter.

I don't like MS particularly (not that I'm a Linux fan either) but it is a fact of life and pretending it is not there is IMHO imitating an ostrich.

If you do write a VXD, you're wedding your application to Microsoft's technical "progress"- you still haven't bought the simplicity of exclusive hardware access. Ultimately it resembles a kludge. What happens when Microsoft releases some upgrade that breaks some formerly undocumented behavior which your vxd implicitely requires for appropriate timing?

I think if its timing critical it just can't run under anything Windows related. It requires either something like DOS or a proper RT scheduler.

You're a software engineyah! If I wanted to be one of those in order to
just USE my computer I would have gone to school in it. I don't wish to
have to write either one thanks!! That's NOT what life is for, to have
to write your way around YOUR OWN computer to get something done! If I
wanted to write a letter to someone it would be related to me, thanks!
I just want the fucking system to get the fuck out of the way of
Assembly, BASIC or Forth!! It can DICK with other Windows apps all it
wants, but it should leave DOS-mode programs the hell alone!!

If MS doesn't be careful they are going to be seeing a small company
that does graphical multitaking Forth machines coming up behind and
passing them. It may be a slight mod on the PC platform to make it
more managable, but the apps may be almost all user written!! It may
well take off in its own direction and leave the WinBlows crap to twist
in the Wind!!

All *I* want is a way to get the OS to leave me alone when I invoke a
custom privileged mode, that's all! I don't want it screwing with my
port access or demanding mother-may-I bullshit!! I want the OS to step
aside totally for port access, and if I can't find it, then I may well
go back to a single user multitask OS that's more well-behaved. And I
would do it today if the damned thing simply ran DOS programs
perfectly!! I have seen a couple DOS emulators on Linux machines and
they aren't quite there, but they will be, and a Windows emulator as
well fairly soon.

Stan, I guess you don't get it. I don't WANT to have to write a VXD for an NT or any similar for such an OS that doesn't let me talk to MY port in a language like assembly or BASIC!! Or Forth at worst!! I have little to NO interest in fancy programming, as to me, the computer is merely a tool for diagnosing or operating hardware, if it is not being used to access the Net. I'm interested in robotics and in device programming, and not much else really.

I don't want MY computer to try to force me to do things in a more difficult way! There's no NEED for that for MOST people who use computers1! When I program a device or run an app off the parallel port or an ISA card I want to get to the hardware level ON THE SCREEN!! What else is a computer good for besides that? (Not really a question to me!).

I don't LIKE virtual machines, although running a few apps is handy, but I'm not so stupid that I can't keep track of what tasks are running in my head, I don't need the computer to try to block me at every turn or to hold my hand about things. And I have NO use for programming for Windows or NT at all!

I will prevent myself from having multiple port access by different tasks, or I will take the consequences, thanks, I'd rather learn not to do something stupid than have the machine in my face!!

In case you hadn't noticed this is an electronics newsgroup, not a "computer" newsgroup per se!! I wish these hot-shit programmers would keep their fancy shit at work on their monster boxes that they spend weeks and months programming to defend themselves from hundreds of users. As for ME and for MOST computer users, we are solitary users of our computers, and the most minimal security is sufficient! We do NOT need the damned things trying to get in our face about what we ant to do!!

I thought this thread started out asking if there were any programmers
for PIC microcontrollers that ran under Windows NT. Jeez, did we get far
afield or what?!

P.S. The new ham-pic reflector sounds like a great idea!

Hello all.
Have a unknown black box, dem. approx. 2ï¿½H X6ï¿½ W X4ï¿½ D. Labeled:
AM-6992/U, Amplifier, Radio Frequency. DSGN ACT 13499
PN622-3328-001, MFR 26687 SERIAL NO. B0084 CONTRACT F19628-76-C-0270
U.S.
The unit has 2 N type connectors ï¿½J1 & J2ï¿½. plus power connector (6
pin). Inside unit has several burned resistors. Unit is all solid
state probably 70ï¿½s technology. looks UHF to me, probably signal amp,
but n connectors would indicate otherwise.
I would love to know more on this unit . If any one can help with
description, schematic etc. please let me know. Please respond to
e-mail: shiso@ici.net , or post here.
Thank You. Bruce KD1MW.....

Isn't Software Engineering an oxymoron? I've been involved with about
5 different types of engineering, either as a participant or observer
and "Software Engineering" resembles actual engineering the least of
all. I'm speaking as a programmer/ee, so I imagine I'm as guilty as
any as far as lack of rigor goes.

Whats really funny are the management
sops like TQM and SEI models and whatnot- they attempt to implement
engineering-like paperwork but not engineering-like technical rigor-
or god-forbid, actual MATH.

And who would actually WANT to write a non-trivial NT device driver,
unless forced to. I've done a little bit of actual work with device
drivers- and it is NOT a simple, throw it together type of job. What
with the bugs in Windows and the gratuitous complexity the environment
forces on you, most anything a little complex ends up a time and work sink.

And yes, I imagine Linux people get fussy if they have to do kernel mode
stuff- its lots more difficult than fooling around with Java or something
equally trivial.

I cannot dis-assemble the traps now that they are complete. Any thoughts?

Hello Mark,

Please correct any of the following assumptions if I'm assuming the wrong thing.

By "coaxial trap", I assume you mean traps made out of coaxial cable and PVC pipe, as suggested by N4UU, W8NX and others. Usually the inner conductor of one end of the winding is connected to the outer braid of the other end, and the free ends connected to the antenna wires.

I assume that you first dipped the traps with no wire attached, then added the 12" lenghts of wire in order to facilitate connection to the rest of the antenna. If so, you did it exactly the RIGHT way - there should be NO antenna wire connected when the trap frequency is adjusted.

Adding the 12" wires chnges the apparent resonancefrequency of the trap, but that is of no concern. All that matters is the resonant frequency of the trap WITHOUT the wires attached.

I've posted a few other coaxial trap ideas in the past. You can find them in dejanews by searching on "N2EY coaxial trap".

Hope this helps.

Has anyone else tried a "Small Wonder" QRP rig? Dave Benson has done a marvelous job with this thing. I put one together last weekend and have already worked 9 states with this 1 watt wonder. I could stand it so I "tinkered a bit" :) Changing C8 to a 821 picofared I increased the bandwith to run the entire cw portion of the 40 meter band, and changing C7 let me center the freq. Used a silver mica cap at C8 for stability and replaced the 100K tuning pot with a 10 turn precision. I am now a very happy camper :) This thing is not a DC but a superhet to boot! I am going to build the other bands and have already started on the 30 and have the 80 and 20 ordered. I plan to order the 160 next week. I have owned a lot of radio's but never had as much fun as I have with this one. CU Mitch AE4YW

Greg, I agree, it's just that if you use a well designed VXD interface, you can easily port the driver to a different OS/Hardware combination, I've done this myself several times. That's better than assuming the hardware will not change and going directly to it in the application itself. Then whe you need to port you have to redo the app.

Anyway, if you write for DOS, you end up relying on MS too, with even less support (as we see from this thread) and more problems.

Don't complain about Windoes and Hardware access, just reboot in DOS and the problem goes away. You can't get both the GUI and the Hardware access at the same time

>-Steve

Steve,

I spend my days writing small embedded apps, I start off my life doing hardware design and still get involved in the hardware. I agree that I don't want the OS telling me what I can or can't do.

However ...
Windows is a consumer OS, not a developer OS. It tries to keep those people who don't understand their computers from doing stupid stuff. They are not as good (or as bad, depending on your viewpoint) as, say Apple, but they are better than most UNIX clones.

If you don't like windows in your face, reboot into DOS. If you really think that the Dos Compatibility Box is intended to give you a complete DOS machine in a window then I have a great deal for you on a bridge, almost new, only used by a little old lady on Sundays. It hurts when you do that, don't do that.

If I have to run under windows, the effort of writing the VXD is worth it. If it is too much effort, I reboot into DOS, or I have an old DOS system, running a remote control package so it has no CRT or keyboard, with the control software running in a window. Or I reboot into DOS, DR-DOS, native Forth or whatever.

I woule love for someone to write that magic DOS Box, but I don't have the time, and I don't think MS has any reason to. That's the world as it are, live with it.

On the other had, here's great comment on writing NT drivers from a
Microsoft employee, Nat Brown. This is out of the "Halloween 2" memo,
an internal analysis of the competitive threat of open software and
Linux to Microsoft, that was authored by Vinod Valloppillil and "outed"
by Eric S. Raymond. I don't have the current URL, but this is a pointer.

http://www.tuxedo.org/~esr/halloween.html

" NatBro points out:
An important attribute to note which has led to volume
drivers is the ease with which you can write
drivers for linux, and the relatively powerful
debugging infrastructure that linux has. Finding
and installing the DDK, and trying to hook up the
kernel debugger and do any sort of interaction with
user-mode without tearing the NT system to bits is
much more challenging than writing the simple
device-drivers for linux. Any idiot could write a
driver in 2 days with a book like "Linux Device
Drivers" -- there is no such thing as a 2-day
device-driver for NT "

Exactly!

People who complain about the lack of parallel support in NT are people who are too lazy to download the DDK and write a driver. Does anyone complain that you can't access the hardware from a Unix application, and instead have to write a kernel mode driver?

JDR Micro Devices usually has them in stock. If you have a relatively
standard soundcard though, you may get better performance using
the soundcard as the audio modem to encode and decode, along
with software.

>(approximately) is a NVIS pattern (what is the acronym?)?

NVIS stands for Near Vertical Incidence Skywave. In other words it fires the signal nearly straight up, and the signal comes nearly straight back down. This is excellent for coverage out beyond groundwave range but less than the first normal skip landing zone, IE out to maybe 300 miles. Note that you have to be operating on a frequency which is below the critical frequency for the ionosphere at the moment or the signal just passes through and goes off into outer space. For hams, this normally means 80m and sometimes 40m (with sunspots on the rise, it can work at higher frequencies at times too).

The impedance of a short whip on the lower HF bands is going to be very low anyway, under 12 ohms, so bending it over won't make it much worse. You'll need a matching network anyway.

>How much of a factor is the height of a dipole on how it radiates? I'm
>interested in doing some 40m work with a not-quite-right dipole (with a

>But, the dipole is planned to go into my attic--the attic is on the 3rd
>story of my house. Should I plan to put it up outside, for around town
>stuff (which would give the added benifit of being cut to the right
>freq)? Thanks.

You get the strongest signal straight up when the dipole is 1/4-wave above effective ground (the effective height of ground may not be exactly at the Earth's surface, it could be below the surface, depending on soil conditions, or it could be above the surface if a dwelling is

involved). But any dipole height less than a 1/4-wave will have a strong vertical component to its elevation pattern. Many NVIS antennas are operated only a few feet above ground (but that makes them lousy for other purposes).

I always suggest an outdoor antenna any time it is practical to use one. Getting the antenna away from the house wiring, ductwork, and plumbing will avoid pattern distortions, and usually will cut down on RFI problems with consumer electronics in the house.

>suggestions on a suitable enclosure or experience with this kit ?

You make the wrap around brass enclosure. Go to a hobby shop
and get some sheet brass. Bend it up to form a tight open box, solder
the seams, now solder the open side to the circuit board groundplane.
In other words, the circuit board groundplane closes the box, with the
component side inside. For double sided boards, repeat this process
for the other side of the board.

But you can use a diecast aluminum box too. Hammond boxes are nice,
available from most electronic distributors. Just mount your board
inside (usually to the inside of the cover plate) with standoffs, drill
holes for any connectors, and that's it. Try to find a box where the
board is just a fit. If the box is too big, it can act as a resonant cavity
and make your amp squirrelly.

I have for sale 2 complete twt setups <unk if working>
came from older ham getting out of equipment....
they are Alfred model 502 and model 562
I have another that was part of a 2304 station <not selling>
that showed 200mw output on a bird microwave wattmeter.
make resonable offer, they ARE heavy and are listed
from 2-5 gig outputs ranging from 100-220 mw <on test sheet>
N connector in and out.
<these units are complete with power supply and all, plug in and use>

I also have 1 or maybe 2 Thompson-CSF Th3543c TWT, that list from
5.925 to 6.435 gig collins part @ 270-0634-010 with test data
5.5 volt
2.5kv anode
1.5kv collector
1.5 milliwatts in for 10 watts out
33 db gain
These were said to work fine on 5 gig ham band
and have reduced gain on 3 gig ham band <around 20db gain>
they have SMA connectors, and NO power supply.

I have 1000's of tubes

I have a limited supply of 381 <2c39> tubes

829 tubes <8 available>
823 tubes <2 available>
lots of rectifier tubes, lots of 12at7, 12au7
lots of 6ua8 and such,
Email to
km5rt@ticnet.com
for your needs. I will let you know if I have it.

Anyone who routinely logs in as root to run user processes is a fool.
You are *never* alone on a multitasking OS. You never know
when a disk access may occur. If your user program is mucking
about with the hardware hanging on an interrupt, you *will* have
a corrupted file system. If you must have user level direct access
to hardware, then run DOS, at least then when you hang the system
and have to give it the three finger salute, you're less likely to
come up with a totally corrupted file system.

The answer is a definate Yes and No. It depends on the transceiver. Many ham repeaters are made from old commercial transceivers. Examples are GE Mastr II, Motorola Mitrek, Motorola Micor etc. Most ham transceivers are not modifiable this way.

Remember that once you are done modifying the radio you only have the easiest and cheapest part of a repeater. You then need to add duplexor, power supply, battery backup, feedline, antenna, and last but not least the site (which is the most important part of all!).

Brian OM,
Regarding learning CW, you will get lots of recommendations. I can
only recommend what worked for me very well.
Once you have the alphabet and numbers memorized as sounds, and can
recognize them pretty quickly, I think there is no substitute for
listening to actual ham radio contacts on the air. If you can
at least borrow a receiver, do it. Code practice with canned text gets
boring real fast, whereas with actual QSO's you will find
interesting things being discussed. Not only that, but it teaches you
the essential operating skills of adjusting a receiver and listening
carefully. If you are one of those who takes to CW, when you become
proficient, it is just another language, essentially effortless to
listen to. Try to get beyond the point of writing stuff down, but that
is OK for starters. You want eventually to be able to copy in your
head, just a when someone is speaking to you.
When you are learning the letters, say the code to yourself every
chance you can: magazines, license plates, road signs, anything that you
see, speak out the sounds of the Morse characters. You want to get used
to thinking of the letters as morse characters automatically.
I learned the code with a key and doorbell buzzer, and was able to buy
an old receiver at a pawn shop shortly after. Once I started listening
to other QSO's, I wrote everything down. Then a few days (and many
pages of paper) later it occurred to me that most of the writing was
completely unnecessary. From then on, CW became music to my ears.
Still is, after 43 years.
Best of luck, and 73,
Don, W6JL

5022. TPRS Fall digital symposium - Dec 12th

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-23 00:00:00 UTC
From: Tom McDermott <mcdermot@NOSPAM.aud.alcatel.com>
Message-ID: <3659BE26.F8F3E37@NOSPAM.aud.alcatel.com>
Source record: 76509
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

The Texas Packet Radio society will be holding the 1998 Fall Digital Symposium
on Saturday, December 12th, 1998 at The University of Texas, Austin. It will
be in room 240, Sanchez education building starting at 8:30 AM. Details, maps,
etc. can be found on our web site: http://www.tprs.org This year, there will be
4 sessions. There will be a tutorial session on 'LINUX and networking'. Also,
demonstration of LINUX on an IDE-compatible FLASH card (boots really fast). There will be a report on the TAPR FHSS radio - there is a
TCP/IP stack operational on the radio itself.

--------- Agenda ----------

Friday night, Dec 11th 7:00 PM+ Dinner at Sholz Garden, Austin

Saturday, December 12th UT Austin, Room # TBD

Session I. Tutorials 8:30 - 9:30 AM
A. Linux systems -Stu Green
* Setting up Linux as a gateway router.
* How to setup routing tables, default routes, etc.
- Static vs. dynamic addresses, class-c addresses, etc.
* Tunnels - what they do, how to set one up.
* Proxies / IP address masquerading
* Slip and PPP on serial interfaces
* Ethernet interfaces

Session II. Project Reports 9:45 - 12:00
A. FlashCard OS Project - John Koster, W9DDD
B. FHSS radio project status - Tom McDermott, N5EG
C. TexNet - APRS capability, AX.25 tunneling - Bob Morgan, WB5AOH
D. ISP interconnection project - Joe Borovetz, WA5VMS

Lunch 12:00 - 1:30

Session III. Operational Issues 1:30 - 3:00
A. BBS, DXC - David Wolf, WO5H
B. APRS - Mike Heskett, WB5QLD

Session IV. White Paper brainstorm session 3:15 - 5:00
Greg Jones, WD5IVD - discussion leader
Purpose is to define a white paper that can be used as a guide to advise

people
how to safely setup a gateway including routing, maintenance, and
administration
for IP interconnection arrangements. The interconnection arrangements
that this
paper should cover include:

- AX25IP tunneling
- Spread spectrum radio interconnection to an ISP
- Straight and Masqueraded addressing
- Dynamic and Static addressing
- VPN (Virtual Private Networking) for closed tunnel groups

Bill,

Try Antique Electronics Supply at:

http://www.tubesandmore.com/

They have a new one in their product line that can handle 12 watts. I think
they sell it for $19 or something in that price range. I bought one about 2 or
3 months ago and it's great. These are new and made (I think) by Hammond.

==========
Many types of dual band 144 / 440 Mhz FM transceiver can be set up
as a 'cross band' repeater using the same dual band antenna. It's
just a matter of pushing a few buttons as per the instruction manual.
No soldering iron required.

Obviously this is true for nearly everything a computer does when talking
to a "slow" device.

Worthy of note is that it's usually possible to use the silly method you
relate on an 8088 machine and get the job done faster than good program
design can do with the hottest Pentium on the market and a bloatware OS.
Back in 1981 I was doing 115,200 BPS communications on the IBM PC, and
analysis showed that I was reading an empty data register much more often
than I was getting an incoming byte. (The analysis itself slowed down the
program a tinch, by incrementing 32-bit counters.) Right now I note that
my 486DX4/100 with WfWG 3.11 can't duplicate that feat, even getting overrun
errors at 57600 with a noncontinuous data stream (52000 BPS from modem)
and after a year of tuning Windoze to get *that* much performance. The
DX4/100 is probably a hundred times as fast as the 4.77 MHz 8088... but
then, the 8088 didn't have to execute ten thousand instructions to get a
single byte from the UART. (Remember also that WfWG implemented serial
commo as a VxD for speed.)

But even back then, sloppy programming prevailed. I disassembled the BIOS
on my first HD controller card and tweaked the code, and took it from just

being barely able to handle 5:1 interleave to humming along at 2:1. The hardware was capable, but the programmer wasn't.

You might look for a 70.7 V line to speaker transformer for distributed sound systems. These are probably close enough to 600 ohms to work okay for what you want. If you can't find one locally they're available for $4.90 from Parts Express at http://www.parts-express.com or 1-800-338-0531. The part number is #300-040

> Art

By now, you've got a bit of advice on where to obtain sheet copper.

Now, let me recommend against it. You simply don't want that much wind resistance, especially in the Chicago area. Consider making the discone out of spokes, like most of the commercial models.

I built one about 20 years ago using coat hangers. It lasted over 15 years along the New Jersey shore, until a Nor'easter eventually tore the disc off and dropped it in my front yard. I don't think one made out of sheet metal would have lasted nearly so long.

Otherwise, check hobby stores for brass sheet stock. Most have a good assortment of sizes.

Source record: 76519
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Don't wate your time with TPRS's digital symposium... It's is rip-off, run by folks who intend to destroy, not build the packet radio network.

These morons actually plan to shut down working packet radio networking, and replace those nodes with Internet connections.

TPRS, (Texas Packet Radio Society) has recently come out of the closet as a Non-Ham organization. According to the TexNet network manager, N0CCW, only the name has anything to do with Amateur Packet Radio. TPRS is not, in fact, an Amateur Radio organization no matter what it's name may imply.

It's ironic but true that if you want to support Amateur Packet Radio in Texas, The "Texas Packet Radio Society" is the very last place you should consider sending your money. They are not interested in building an Amateur Packet Radio network at all.

Take a look at the May '98 issue of TPRS's "Q-Report" to see what I mean.. No mention of packet radio, except how it's somehow just not good enough.. The bulk of the newsletter is dedicated to the "great challenge" of abandoning Amateur Radio so that all of TexNet's nodes can be linked to each other by the Internet instead. - Along with an implication that in the near future, TexNet nodes without good *Internet* connections will be phased out of the network altogether. I know that many of the TexNet node-ops are real Hams, and these appear to be the ones TPRS intends to edge out.

What kind of an organization would deliberately plan on edging out Hams using
Radios in favor of "digital communications hobbyists" using The Internet, or "wirelines" donated for the purpose by commercial communications outfits? Why TPRS, of course. - The worst enemy of Amateur Packet Radio in Texas, and the best friend of the commercial communications outfits who would love to grab up our spectrum.

When irresponsible "digital communications hobbyists" go out of their way to undercut our use of Radio by Hams, imposing instead an unseemly dependence upon Non-Ham means of communication, they leave all Hams wide open to attack by commercial communications outfits who covet our bit of spectrum. " Why do they need (Insert Band here) if they prefer to use the Internet anyway? " -- A very good question!

Why, I wonder, is the "Texas Packet Radio Society" so cozy with commercial communications outfits, constantly pushing Non-Ham means of communication while distancing themselves further and even further from Amateur Radio and their fellow Hams?

That's not the kind of people I would care to be associated with. I'd rather work with Hams. - Real Hams who want to see Amateur Packet Radio advance and grow.
A few members of the isolated, insulated little clique that has controlled TPRS since it started are of a mighty high opinion of themselves.. They appear to believe that if THEY cannot figure out how to surmount a problem, then of course nobody else ever will or could either, and that the best policy for all Hams is to "be realistic" and give up on Amateur Radio right now, in an organized fashion.

In fact, most of the innovation and industry recently associated with the Texas Packet Radio Society appears to have been in that very direction; Leading Hams to abandon Amateur Packet Radio networking in favor of Non-Ham means of communication.
N0CCW was giving us the straight scoop when he said that TPRS is not an Amateur Packet Radio organization. It appears to be the exact opposite.

This is why roughly half (over 1000 miles) of the current Texas TexNet "Packet Radio Network" is actually donated wireline links. They claim to be the biggest Amateur Packet Radio network... Well, remove the 1000 miles+ of Non-Ham links and all of a sudden they are running a distant fourth place. Still impressive, but not for long if TPRS's newsletter can be believed. They appear to be ready to deliberately phase out the use of Amateur Packet Radio soon, so that TexNet will no longer be an Amateur Packet Radio network at all. -- And they look forward to that as "progress" ?? ! ??

I guess it may be "progress" for the isolated/insulated TPRS clique, but it sure isn't good news for Hams, whether they live in Texas or not.

When "Digital Communications Hobbyists" (Packet Hackers) route Amateur Packet Radio network traffic over the Internet, they directly undercut the essential reason for allowing Amateur Radio operators the stewardship of our bit of spectrum in the first place.
They cut the throats of all of their fellow hams in the eyes of Congress.

Additionally, simulated "packet radio networking" using Non-Ham means of communication only serves to displace and replace genuine Amateur Radio networking efforts. - It edges out the Hams.
The president of TPRS, Tom McDermott N5EG, does not appear to be content with the speed at which Hams are being edged out of the packet net in the U.S., and is doing what he can to accelerate the process.
What a guy.

When the Hams in Texas decide they would like to initiate a new, REAL "Texas Packet Radio Society", which clearly states in it's charter that the organization is dedicated solely to advancing Amateur Packet Radio, I will be glad to participate.

TPRS's charter does not call for dedication to Amateur Packet Radio. It is a "digital communications hobbyist" organization instead, which explains why TPRS has had no problem in turning against Texas hams, working to destroy
Amateur Packet Radio networking in Texas, and replace it with an utter

dependence upon Non-Ham means of communication. (Internet, Wirelines, ect..)

I have too much personal pride as a ham to associate myself with a Non-Ham organization like TPRS, or the "Non-Hams" who run it. When I want to use the Internet, I dial up my ISP. When I want to utilize Amateur Packet Radio, I use radios. I will not associate myself with persons who cannot comprehend that simple distinction, and who show no respect for Amateur Radio and their fellow hams.

I am a Ham Radio Operator, and not a "digital communications hobbyist", so it
would be a waste of my time (not to mention the slur on my character) if I were to participate in the activities of TPRS.

If "digital communications hobbyists" are starting to take over YOUR Amateur Packet Radio organization, take a hint from the state of Texas, and weed them out right now. You'll be glad you did, and you'll be sorry if you don't.

Thanks for taking the time to look and think this over.

I know that many of the TexNet node-ops are real Hams, and these appear to be the ones TPRS intends to edge out.

What kind of an organization would deliberately plan on edging out Hams using Radios in favor of "digital communications hobbyists" using The Internet, or
"wirelines" donated for the purpose by commercial communications outfits? Why TPRS, of course. - The worst enemy of Amateur Packet Radio in Texas, and the best friend of the commercial communications outfits who would love to grab up our spectrum.

When irresponsible "digital communications hobbyists" go out of their way to undercut our use of Radio by Hams, imposing instead an unseemly dependence upon Non-Ham means of communication, they leave all Hams wide open to attack by commercial communications outfits who covet our bit of spectrum. " Why do they need (Insert Band here) if they prefer to use the Internet anyway? " -- A very good question!

Why, I wonder, is the "Texas Packet Radio Society" so cozy with commercial communications outfits, constantly pushing Non-Ham means of communication while distancing themselves further and even further from Amateur Radio and

their fellow Hams?

That's not the kind of people I would care to be associated with. I'd rather work with Hams. - Real Hams who want to see Amateur Packet Radio advance and grow.
A few members of the isolated, insulated little clique that has controlled TPRS since it started are of a mighty high opinion of themselves.. They appear to believe that if THEY cannot figure out how to surmount a problem, then of course nobody else ever will or could either, and that the best policy for all Hams is to "be realistic" and give up on Amateur Radio right now, in an organized fashion.

In fact, most of the innovation and industry recently associated with the Texas Packet Radio Society appears to have been in that very direction; Leading Hams to abandon Amateur Packet Radio networking in favor of Non-Ham means of communication.
N0CCW was giving us the straight scoop when he said that TPRS is not an Amateur Packet Radio organization. It appears to be the exact opposite.

This is why roughly half (over 1000 miles) of the current Texas TexNet "Packet Radio Network" is actually donated wireline links. They claim to be the biggest Amateur Packet Radio network... Well, remove the 1000 miles+ of Non-Ham links and all of a sudden they are running a distant fourth place. Still impressive, but not for long if TPRS's newsletter can be believed. They appear to be ready to deliberately phase out the use of Amateur Packet Radio soon, so that TexNet will no longer be an Amateur Packet Radio network at all. -- And they look forward to that as "progress" ?? ! ??

I guess it may be "progress" for the isolated/insulated TPRS clique, but it sure isn't good news for Hams, whether they live in Texas or not.

When "Digital Communications Hobbyists" (Packet Hackers) route Amateur Packet Radio network traffic over the Internet, they directly undercut the essential reason for allowing Amateur Radio operators the stewardship of our bit of spectrum in the first place.
They cut the throats of all of their fellow hams in the eyes of Congress.

Additionally, simulated "packet radio networking" using Non-Ham means of communication only serves to displace and replace genuine Amateur Radio networking efforts. - It edges out the Hams.
The president of TPRS, Tom McDermott N5EG, does not appear to be content with the speed at which Hams are being edged out of the packet net in the U.S., and is doing what he can to accelerate the process.
What a guy.

When the Hams in Texas decide they would like to initiate a new, REAL "Texas Packet Radio Society", which clearly states in it's charter that the organization is dedicated solely to advancing Amateur Packet Radio, I will be glad to participate.

TPRS's charter does not call for dedication to Amateur Packet Radio. It is a "digital communications hobbyist" organization instead, which explains why TPRS has had no problem in turning against Texas hams, working to

destroy
Amateur Packet Radio networking in Texas, and replace it with an utter dependence upon Non-Ham means of communication. (Internet, Wirelines, ect..)

I have too much personal pride as a ham to associate myself with a Non-Ham organization like TPRS, or the "Non-Hams" who run it. When I want to use the Internet, I dial up my ISP. When I want to utilize Amateur Packet Radio, I use radios. I will not associate myself with persons who cannot comprehend that simple distinction, and who show no respect for Amateur Radio and their fellow hams.

I am a Ham Radio Operator, and not a "digital communications hobbyist", so it would be a waste of my time (not to mention the slur on my character) if I were to participate in the activities of TPRS.

If "digital communications hobbyists" are starting to take over YOUR Amateur Packet Radio organization, take a hint from the state of Texas, and weed them out right now. You'll be glad you did, and you'll be sorry if you don't.

Thanks for taking the time to look and think this over.

As others will tell you , It depends on the radio. If it is an older ham rig or comercial transciever that normally has a crystal controlled receiver and transmitter you may be able to do it. The receiver and ransmitter has to be two seperate pieces. I have converted a GE Mastr II mobile unit with no problems. Also an older Clegg FM-76 220 MHz unit. That was a little harder as some of the circuits for both sections were on one circuit board.

The worth the effort will have to be determimed by you . Outside of the controller, duplexer and antenna, you will not have too much trouble with the radio part of the conversion if the correct transceivers are picked. Do not try to convert most of the modern rigs as there is too much interconnected stuff on the boards and some of the receive and transmitt circuits are in use at the same time.. Well maybe need to be used at the same time and you can not do that.

An additional note Don, if your still in the learning stages but have an interest in VHF or UHF communications I highly reccomend building a kit. Look in QST or 73, if you can spring for the hundred bucks or so there is a company called Hamtronics I believe that makes reciever and transmitter kits designed for this type of service, or try one of the Ten Tec 6m or 2m trancievers. I only wish I had built more when I was a Novice 20 years ago, it will increase your knowlege of radio and how things work at an exponential rate! IMHO...

How about measuring the strength of a somewhat distant radio station
and how it changes with time of day. What you will need is a receiver
with an s meter. They could record the reading every hour by hand, for
example. If you could tap into it with a digital VOM you would get
more accurate results. Or with an A/d converter and a computer it could be
automated.

Fritz,

Signetics (I think) had an Application Note showing how to make a SCA decoder using one of their PLL chips. That was decoder only. No radio front end. Muzak (the "elevator music" people) made a lot of receivers for SCA. THey were crystal controlled one station FM radios. Maybe you can find one at a swap meet or something.

Go to your local home improvement/hardware store. Look in the plumbing department at the copper plumbing. Is there any copper pipe that is big enough for your amp to slide inside of? Buy the shortest piece you can (usually 4 or 5 ft) and some copper caps (end pieces). Go over to the screw and bolt section and buy some sheet metal screws that will just go through the cap and into the copper pipe. (Buy the way, buy a tubing cutter if you don't have one already).

Go home and put it together. you can't get much better than solid copper for sheilding. If you want you can solder one of the caps and use the screws to hold the other one on, so you can take it apart if needed.

Mount the power and RF connectors on the ends. Or use a copper T fitting.

>
>No one gives a shit about some sniveling pecker-puffer who says otherwise.

Normally I would most heartily agree with your assessment Steve, but you must understand that when TPRS "says otherwise" to Hams using radio, they affect a lot of Hams who might have mistakenly thought that TPRS was an Amateur Radio organization. The name "Texas Packet Radio Society" is misleading in that respect.

I wouldn't call the TPRS guys "sniveling pecker-puffers" when "LandLine Lids" is much more accurate and to the point. I have left Greg Jones completely out of this discussion, and there's no need to bring him into it now. Although Greg still has a cadre of butt-kissers within TPRS, he is no longer an officer of that organization and hasn't been for several years.

Hams end up supporting TPRS, giving them their hard-earned cash, not knowing that TPRS will take their money and use it to work *against* Amateur Packet Radio networking, not for it as thier name implies.

Just setting the record straight, OM.

Your lack of knowlege is sticking out, Steve.. Better tuck it in, old boy, and zip it up.

(Or at the very least, check your facts. I haven't worked with the LandLine Lid organizations in the last few years, but it's a big planet. Lots of legitimate Ham organizations to work with, and no need to "rub elbows" with geeky lids in order to participate in them. I've been active, but only with legitimate Ham organizations.)

Yes, that's exactly what I have done, and it's worked out pretty well. It's nice working with competent Hams, instead of the geeky Lids infesting TPRS.

5048. New program TRAPDIP.exe

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-23 00:00:00 UTC
From: Reg Edwards <G4fgq.Regp@btinternet.com>
Message-ID: <01be16b7$c3b38160$LocalHost@default>
Source record: 76581

From the number of questions asked on newsgroups about trapped dipoles this type of antenna does not seem to be so popular as it was. The scene has shifted towards all-HF band random-length dipoles centre-fed via open-wire lines and matched to the transceiver with a sophisticated tuner.

But for construction simplicity, a two-band trapped dipole fed directly via a 50 or 75-ohm coaxial line, with or without a simple tuner, cannot be bettered.

Program TRAPDIP.exe accepts two frequencies, usually but not necessarily in adjacent HF bands, overall length and height above ground. It calculates trap inductance, capacitance and position along the antenna. For given coil former diameter and length the program then computes number of turns, wire diameter and wire length.

Input resistance at each of the resonant frequencies is found. Also the percent of input power dissipated in the traps, in the antenna conductors and in the soil under the antenna. If you are thinking of experimenting with a trapped dipole, or already have one and have often wondered where it all goes to, you may find this program of interest. Built-in operating notes.

Download in a few seconds. One self-contained file only. Not zipped-up. Can be run immediately.

We need some more info, what type of rig are we talking, what band or bands, if is on the same band the answer is no, the vfo is common to the transmiter and resiver so you could not have the ofset to transmit areseive. now if you are planing to doit on a cross band and you are using a dual band rig then yes it can be done even if the rig was not originaly used as crossband. many of the newer rigs are ready to go for that purpose.

by the numbers they are low frec rf and or audio low power transistors, the onlu cuestion I have is the gain that they have, by experience they have arround 100 to 150 of gain but to be sure you must mejure them . Most newer dijital testers can do that .... if you do not know the location of the terminals, some testers will tell you what terminal is what and also will tell you the gain.
as for the terminals on the metal can ...the collectoe normal;ly has a line on the can next to it or a tab pretuding from the can next to the collector
Now you would have to play with polarization jjust trem the type of transistors do not operate at more than 24v and the base never exiding more than 3/4 of vcc. you must check for pnp or npn
good luck N6YOC

Amidon resells Micrometals powdered iron cores, and Fair-Rite ferrite cores. (At least, they use the type designations and data from these manufacturers.) I noticed in the flyer that came with the cores that they also offer one "Type J" ferrite. This is a Magnetics designation, and I assume those cores come from Magnetics.

It didn't cause me any real trouble at all, except now I'll have to find another source of known 77 type cores. I got them for the sole purpose of making some measurements, so the first thing I did was measure the impedance of a small winding at a couple of frequencies. The error showed up right away. But if I had been making a low-frequency or high-powered balun, a broadband transformer, or some other application requiring the unique properties of one type or the other, I might have scratched my head for quite a while before finding the source of the trouble.

Anyone can make mistakes -- I sure make more than my share! But this is the kind of mistake that isn't obvious to the user, so it can cause lots of grief. If it's a rare occurrence, I fully understand and don't hold anything against Amidon at all. But it should be rare.

It's easy to tell a type 43 from 77, if these are the only two which are mixed. Just touch an ohmmeter, set to the one megohm scale, to the core. You'll get a low value reading on the 77; a 43 will show open.

5059. Conversion of analog cell phone to 33cm transceiver?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-23 00:00:00 UTC
From: adam@onramp.net
Message-ID: <MPG.10c2cc39af604a72989684@news.onramp.net>
Source record: 76592

I have recently retired an Ericsson analog cell phone in favor of
digital service. I was at a loss about what to do with the old phone,
but it occurred to me that since it operates in the 800 mhz range, would
it be possible to convert it to the 33cm bands?
Any suggestions or comments are welcome. This would be my first
homebrew project (besides antennas and so forth) and I wouldn't want to
bite off more than I could chew, so to speak.
Thanks!

several older radios such as motorola mvp and g.e. exec can be
modified/converted
for repeater use in the same band.

they are rock bound and utilize diff rx/tx sections

go to:
http://www.qrz.com
and goto radio mods.
look for repeater

For the best price, give some of the many scrap yards you have a call. Next check with one of your local machine/sheet metal shops, if they don't have what you're looking for, ask them where they would go. As a last resort there are several steel companies down there that could supply you.

It's plenty worth it if you have a radio such as a GE Master II. They
modify really easily. And they work VERY well.
The smaller compact under dash radios, like Motorola Maxtracs are definately
not worth the effort.

> Is it worth the effort to do this???

Hi Don:

Yes, some can and some cant. Unless I'm mistaken the true definition of a tranciever is that is shares the IF for both transmit and recieve in which case it's a little more difficult to separate them. Many of the older commercial VHF/UHF rigs actually had a completly separate transmitter strip and reciever strip in one box making it in reality a TX/RX pair but of course referred to as a tranciever. There are quite a number of repeaters using this very sheme, take one tranciever apart, split it, xtal it up for the appropriate frequencies and then add a controller, duplexer etc. Sure you could modify it to run as a repeater and probably keep it in the same box. Remember the key to being able to transmit and recieve in the same band at the same time lies in how well you can tune the reciever so that it only hears the recieve freq and not the transmitter 600KHz away. This is why duplexers are used, they basically provide the reciever with a very very sharp front end allowing only the desired freq to pass and filtering the rest. Think about trying to hear your buddy on 146.52 a mile away on a rubber duck and there is a guy 10ft away transmitting with 100 watts a few kilohertz down the band, your poor reciever doesn't stand a chance without the help of a good filter notching out the 100 watt transmitter. It's like trying to see a lit match in front an automobile headlight.

Worth the effort?, that one is your call. It can be a lot of fun to build a repeater from scratch by doing what your describing but it IS a lot of work not too long ago it was the only way to build a repeater, no one had them off the shelf as they do today.

I think the normal transceiver can not be a repeater,transmitter and
receiver are working on the same time, the working condition have two,the
first is,you transceiver have two bands(like VHF & UHF),and TX on VHF,RX on
UHF,But this is not a good idea,
the users of team need to use two bands portable radio or mobile radio,when
user are talking to somebody from repeater,then must turn off the receiving
band's volume knob(sometimes you must to check this receiving
band),Inconvenient for a user.the other method to use two transceiver(same
band),and working separate(one TX and another RX) on the same time,on the
same band but not same frequency.now you must to choice two freqs.they can
tune 600KHZ~10MHZ(or High)away.these radios connect to a Duplexer,there are
3 connectors on a Duplexer,your Duplexer was tuned(your freqs.) before
setting.
many brands on the market,Motorla,Kenwood,YEASU,Icom,GE,Uniden,JRC.....If
you need cheap one,you can buy Motorla GR series,GR300,GR500 etc....
a little suggestion

> Is it worth the effort to do this???

Some can, some can't. It depends primarily on how the local oscillators
are generated. Things like the Motorola Micor and GE Mastr II (that's
the way GE spelled it) use separate crystal oscillators for transmit and
receive. It is a simple matter to split these radios so that they can serve
as a repeater. In fact, the majority of amateur repeaters are probably made
from one or the other of those two radios, or varients like the Exec II or MVP.
These are available surplus at very reasonable prices (they were originally
used in Land Mobile service as trunk mounted mobile radios).

Many synthesized amateur transceivers only have one synthesizer.
That's switched back and forth for transmit and receive (the receive LO
has to be offset by the intermediate frequency of the receiver, usually
10.7 MHz). These radios can't be split for repeater operation unless
you somehow outboard another LO. (And you may still have isolation
problems with most ham rigs.)

Some dualbanders have dual in-band receive capability, and that
requires two synthesizers. These can probably be split, but typical
ham transceivers have such poor front ends (poor IMD response
because hams seemingly want them to cover DC to daylight) that it
isn't worth the effort to try to split them to form a repeater. You want
a good tight strong receiver for a repeater. The Micor, and especially
the Mastr II, have that, most ham rigs don't.

Note, most of the "true" dualbanders can be used for crossband
repeater service (at reduced power). That doesn't put as much
demand on isolation between transmitter and receiver as does
in-band repeating. But for a conventional in-band repeater, you
need something better.

Exec II and MVP radios go for about $50, and a Mastr II will
command about $100 (you don't need the control head or cabling
to use them as repeaters). The Mastr II will loaf along at 50 watts
(rated at 110 watts for mobile service, but you want to turn it down
for repeater duty), and the receiver is really bulletproof. There are
a lot of these radios still around, though they haven't been produced
for a while now. They seem to last forever. Our repeater group has

6 repeaters using them now, and we almost never have to go to the repeater sites to adjust or repair them. They just keep going like the Energizer Bunny.

As a final note, I wouldn't recomend trying to use a synthesized radio as a repeater in any event (even a pair of synthesized radios) because the phase noise of the synthesizers will give you fits with desense problems. Stick with crystal control for repeaters. (Some late model commercial repeaters are synthesized, but the designers took great pains to control phase noise in them. Most ham equipment designers don't.) The RF fields at typical repeater sites are *intense*. You need a very strong receiver to deal with them. These old Motorola and GE radios have that, late model ham gear doesn't.

Seems to me that RAMSEY KITS has an SCA decoder. Both the decoder
proper and an FM radio designed to accept it.

You can buy these at Radio Shack. I'm using them with my SP-325s. I think they're sold as audio output transformers, 600 or so ohms to 3.2 or 4 or 8, don't remember exactly, here at work. Was about $3, works fine.

Works great, nice receiver, but you can also get the Radio Shack 2m
mobile on sale for $200 if you want to wait for a sale. I have both, and
I like them both. I also built the optional power amp for mine.
Definitely easier to install the power amp while building the basic kit
than installing it later.

But I bet it worked. I saw some industrial prototype boards made in
just this way, with a toaster oven. I think it was done someplace
with good ventilation like the welding fume hood. (Or the smoking
lounge would be fine - nobody would notice the smell of a bit of
cooked epoxy over all the cigarette tar).

For making production boards, they bought a nice little multi-zone IR
oven with conveyor belt. No more toaster oven.

Source record: 76552

i'm looking for schematics and software (firmware source too)

IWM

type M1090
part no:KRD 102 11/E R1A 93W34
seral num:
fcc id ITK M1090- MOBITEX
made in sweden
INTEL

I lucked into several dozen IWM's these things are simply a 900 mhz
9600 baud radio modem .. they used to utilize the digital pager network
to provide bi-directional e-mail and limited access to servers on the
internet in the us and canada.

but as technologies progressed (cellular phones/modems) these things
got left by the wayside ....
and ram mobile data no longer supports them as does GTE MOBITEX

well, what i am trying to do is ... hook up a small network offshore
(marshall islands) between my boat and several locations on shore...

any ideas?

my closest neighbor is 46 nautical miles away by boat.... i don't think
these will carry more than 5 miles maximum
thanks,

>>Hi,
>>
>>
>>what's the best way to solder IC in a ?SOIC package with a soldering iron?
>>
>>
>>
>>Peter
Hi.

For me, I have a different approach that we use commercially. (Low quantity.)

Our surface mount line doesn't have the accuracy to place 25 mil pitch parts, so we place them by hand. Here's how. (This takes a lot of faith the first time you do it.)

1) Position the IC.
2) Using a standard (small) soldering iron, tack down two opposite corners, don't worry about shorts.
3) Inspect, very carefully, for alignment. Its weird how two opposite corners can be perfectly placed and yet parts of the chip don't line up. If not PERFECT, heat the solder in the offending corner and move (gentle lift and move and place) the part, as needed. Repeat as needed to get the part in perfect position.
4) Tack down the other two corners.
5) Inspect again. Its still not too late to fix misalignment.
6) Here's the scary part. Being careful not to drag the soldering iron and move the IC's pins, flood the pins and pads with solder!
7) Again, with care not to disturb the IC's pins, use solder-wick to remove excess solder. It'll suck out all the shorts that you made when flooding the pins with solder and leave a beautiful set of solder fillets.

The biggest trick to the above technique is to not displace the pins when flooding or cleaning afterwards. If the pins get dragged off their pads, it is real dicey trying to place them back without destroying the board. Also, the pads that these pins are landing on are very small, and as such, have very little surface area attaching them to the substrate and are easy to lift off.

We place 144 and 208 pin parts this way. Just takes a couple of minutes per part, after you do the first one or two.

*> . . .
*> Roy, there's hope on the horizon! If Motorola (Ericsson,Polyfet etc)
*> stick with
*> it , we may yet see LDMOS plastic at nice cheap prices. The MRF1508 looks
*> super and is easy on the wallet ! Have you tried any of these devices?
*
*No, my experimentation with power FETs so far is limited to the
*IRF510. (To be truthful, I'm really using an IRF511, which isn't quite
*as good for 12 volt operation, but it's what I had on hand.)
*
*I know Motorola makes some power FETs for RF amplifier use, and think
*they have considerably lower capacitance for a given on resistance as
*compared with the conventional power FETs like the IRF510. But I also
*was under the impression they're relatively expensive and not as easy
*to get hold of as IRF510s. I assume the MRF1508 is a Motorola part,
*but it's not in my 1994 RF Device Data catalog (time to update!). I'll
*certainly be interested in the results of any experiments. What do
*they cost, and are they fairly available?
*
*I think the real solution for using conventional power FETs is what
*others have posted here -- raise Vdd to 24 volts. That way, you can
*get by with a higher on resistance/lower capacitance part. (I'm
*interested only in CW, but understand that the higher Vdd also
*significantly improves the linearity of SSB amplifiers.) I want my
*rigs to run from 12 volts and so far I've been too lazy to whip up a
*switching converter, but one of these days. . .
*
*Roy Lewallen, W7EL
****

Roy:

My Senior project used two stage amplifier block using MRF5003s to drive an MRF 255 at 50 Mhz for 40 watts out with 4 mW drive. The MRF5003 were operating at 7.5 VDC and the MRF255 was at 12.6 VDC.

The devices are pricy. About $19 dollars for the MRF5003 and $60 for the MRF255. That is RF parts PRices range. I got them as samples.

Regards
James

Hi there Don ,
I too are wondering if power Mosfets (in a TO 220 package) can be used in RF stuff .
Two of them that you can buy here in Australia are fairly cheap ie an IRF 830 and an IRF 520 but I can't get much data on it .I can get the maximum V,I and power that these things will work at but not there max frequency .

Could you help me .....Nigel Pendlebury .

Cross-posted to: ott.forsale.computing,rec.audio.marketplace,rec.radio.amateur.homebrew,rec.radio.swap

We need the following items in Quantities Of 1 TO 550:

Hard drives 2.1gb-6.4gb new only (paying 50.00 to 110.00)
Pentium Pro 200-256k@512k CPUs (paying up to 150.00 & 220.00)
Pentium Pro 200-1meg cache (paying up to 500.00)
16mb and 32mb simms also 64mbs (paying 11.00 and 20.00 ea.)
Pentium 200 mmx and k6-233 (paying up to 50.00 each)
Pentium 200 CPUs non mmx (paying up to 75.00)
Pentium Pro 166-512k (paying up to 75.00)
Adaptec 2940uw controllers (paying up to 90.00)
Floppy Drives 1.44 new w/face (paying up to 8.00)
Pcmcia modems 28.8 & 33.6 (paying 15.00 and 20.00 ea.)
Also looking any type memory in quantity email your list.
And all other excess computer products in quantities 1-700.
E-mail or call with your list.

Note: We only buy working products. New, used or refurbished
is fine. Software must be new and unopened with all certificates.

Computer Surplus Outlet is a Company engaged solely
in purchases of EXCESS COMPUTER INVENTORIES. We have
access to purchase any quantities or lots available.
We are not a broker. This is our only business and
expertise.

Our team of buyers are waiting to give you the highest
possible bid in the country. Response on the bid will
within 24 hours.

HOW IT WORKS:
After agreed upon price we will issue a Purchase order (PO#)
which must be on the outside of your box. You furnish your name
and address that you want the check mailed to. You allow up
to 3 days for receiving and testing of your products. Then your
check is mailed. In some case we will provide our Airborne
account # for the shipping and also will accept COD
in other instances. We make it EASY MONEY for YOU.

5101. HELP! Need mod for IC-T2H

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-25 00:00:00 UTC
From: "Rich Harman"
Message-ID: <73gedr$966$1@dns2.serv.net>
Source record: 76414

Hi all,

I have looked everywhere that I can think of for a mod for the IC-T2A.

I am a hang glider pilot and would like to be able to tx on 151.625 -
151.955 (USHGA frequencies)

I spoke to tech support at Icom, they said that there is a mod which
involves removing a diode but couldn't give me the details.

Myself and at least one other person would greatly appreciate information on
how to do this mod.

Thanks in advance,

Rich

Works perfect, if You have a PCB with solder mask. If You have a homebrew board You will end up with invisible bridges underneath Your IC.
I strongly recommend to use solder flux pasted over the pins (I use a pen style flux dispenser). Put some solder to the solder tip, hold the PCB in a way, that You can solder downwards and solder all pins in a row in one slow move. The solder flux keeps the solder clean and wet and only the necessary amount of solder remains at the pins. Only a few pins may have shorts, which can be easily removed again applying some solder flux and using solder-wick.
After You have soldered the whole board You can clean it with acetone to remove all solder flux.

Gentlemen,
I have a Knwd DSP-100 that does not seem to function on rcv. All cables are good. Is there something in the manual for the DSP that I am overlooking? I do not have the manual. Is it simply plug and play or is there something that needs enabled?

Any help would be appreciated.

I've made a couple of tachometers, and found that the frequency-voltage conversion is the easy part. I've always done it by just generating a fixed-width pulse, then doing the conversion by filtering it with an RC filter. (The pulse width is simply changed to accommodate engines with different numbers of cylinders.) The harder part is cleaning up the input signal. Here, I've used a combination of zener and filters prior to triggering the one-shot. It's been a long time, though, and I don't know where to find a published circuit. My homebrewed ones also used a direct connection to the points, and you'd have to use a different pickup scheme with today's electronic systems.

Source record: 76423

Thanks to Roy for posting the response on the ferrite mixup.
I just tested some "61" toroids from Elna and found that they
were twice the correct inductance, making them "64" or something.
This is actually a good deal because I already had some real 61
cores, and now I have more choice of materials. I didn't even
know that you could get the big (2.4" 3801) toroids in 64.
Next time, I check 'em right out of the box.

Isoproply alcohol (isopropanol) also dissolves flux nicely, and it's
less likely to attack plastic-cased components than acetone is.

Or, even better, use solder with a water soluable flux & water soluable flux paste. I typically take the paste and mix it with LOTS of water to thin it down until it is very runny. Then use a squeeze bottle to apply the flux (this works REALLY well with solder wick, get the unfluxed kind). Then, just rinse under hot water (from your faucet). Cleans up really well and has zero likelyhood of attacking plastic components. If you use hot water and shake most of the water off, the rest will evaporate pretty quickly so there's no real corrosion problem. I suppose that if you live in a really humid area it could be a problem, but you can dry your boards in your oven set to a very low temp.

We (HP) use water soluable flux pretty much exclusively anymore, as do most other PC board manufacturers these days. Just about all components these days are rated for water wash.

From: "William H. Phinizy" <wphinizy@connect3.com>
Message-ID: <01be18bd$0579b360$93ad43d1@WPhinizy.connect3.com>
Source record: 76427

This probably doesn't qualify as home-brew, but..

Does anyone know where i can find the mod to make a TS-440SAT transmit out of band? I am going to use it with a Ten-Tec 20-meter to 6-meter converter and wanted to cover more than the 350 KHz of transmit that the '440SAT would allow.

..also, if you have experience with the Ten-Tec transverter in this regard, I'd appreciate hearing about it.

Much Thanks..Bill (at k6whp@gte.net)

5115. hamradio-online.com: Low Cost Amateur Digital Video is Now a Reality

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-25 00:00:00 UTC
From: vbook@vbook-nospam.com
Message-ID: <73htr8$k23$1@supernews.com>
Source record: 76428
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.policy,rec.radio.amateur.homebrew

KT4OZ and KB5IHI this week demonstrated the feasability of low cost Amateur Digital Video. Using notebook computers, wireless LAN cards and off the shelf streaming video software, the conducted a two-way wireless digital video link in the 2.4 GHz band. Assuming you already have a computer and camera (which is now common), the total cost of the additional components is minimal.

This technology demonstration shows one path to achieving low cost and widely available digital video in the Amateur bands. Such signals could further be linked via the Internet (since they use standard Internet protocols) to enable connections between distant Amateur TV repeaters. There are many fascinating applications yet to be developed from this technology experiment.

after using acetone at my place of work, I went to a 'pub' for a refresher
and ended up on my nose.
Why, when I can usually drink three or four pints of strong beer without
significant effect was I completely rat-assed after the acetone (exposed to
it about an hour earlier) and ONE pint?.
While its a cheap way to get pissed I really did'nt want to fall over where
I did !!.
Is there a sensible answer??.

Better read the most recent FCC rules for FM broadcast category.

>What are the possible methods and tools to determine if it may be
>a bad connection on the transmitter tower?

This is probably a task better handled by someone experienced in the FM broadcast field. My experience is with land mobile stations to 150 watts.

Working with 50 KW will require about +25.23 db more planning and care.

A quality spectrum analyser, RF signal generator, filters, attenuators, high quality (double shielded) coaxial cables and other gear will be required.

There normally is a sampling port facility connected to the transmission line to tap off a portion of the transmitter carrier. Because of the power levels involved, additional external (high power) attenuation will be required and even then, it may be difficult to see the 9th harmonic without creating an overload condition to your spectrum analyzer. You will need a good bandpass filter at the 9th harmonic in order to attenuate the FM carrier and still see the harmonic energy.

You will also need a notch filter to pull out the FM carrier.

You will also need a calibrated RF signal generator to simulate the level of the harmonic through your test equipment (including all the filters) to determine the level present at the sampling port. This technique may still have some error due to the response of the sampling port at the 9th harmonic. (more later)

You will also need to determine the level of the FM carrier through the sampling port with respect to the harmonic.

Note: the 9th harmonic will have sidebands 9 times wider than the FM signal. This may affect the signal level measured. Test with and without modulation.

You should arrange to test after hours so that the station can be run into it's dummy load versus the antenna.

Also arrange to turn the transmitter off and substitute your RF generator through the transmission line to accurately calibrate your test set up at the FM carrier and harmonic frequencies.

Make tests into the dummy load, the main antenna and the backup antenna if any. Compare results. Try to isolate to an antenna or transmitter problem. A damaged or corroded antenna component could cause harmonic intermodulation distortion.

At these power levels, a harmonic could be generated elsewhere and be re-radiated. Also, even a legal transmitter may generate enough harmonic energy to be picked up on a nearby receiver. I gather you suspect that an 800MHz or 900 MHz SMR system is being affected by this FM station? The tower mounted preamplifiers used on these systems can receive signals down below -125 dBm.

If the SMR receiving antenna is defective or located too close to the transmitter IT could be the cause of the harmonic.

A preamplified TV receiver antenna nearby could be overloaded and could re-radiate such harmonic energy.

By the way, a few years back in Miami, I was trouble shooting interference to the City of Miami 800 Mhz trunk system and found (among other contributing factors) a high powered television translator that was designed to relay a channel 6 television station to an output on channel 69. This device was poorly filtered on it's input and also effectivly relayed several FM stations to around 808 MHz. This translator was on a rooftop several miles away from the affected system.

Good luck and don't get hurt.

I have two Skanti T5000 Commercial Marine Amplifier. Taken off a cruise ship. They are in good working/looking condition. Very high grade parts. Rack mount. These are just the RF Decks. They need a power supplies. Both were tested when removed to be replaced by solid state units. Tubes full ouput. I also have one Sailor HF Marine amp it has two 4CX150s in great condition also.
The Skantis I want $250 each and the Sailor $200. These are not heavy so shipping will not be high. Prices are low and firm. I need a quick sale. Thank you Chris VE3NGW/W4 Florida

Ham Radio.FAQ is a frequently-asked questions file intended to
summarize some of the common questions and help beginning ham
radio operators get started.

If you aren't yet a licensed ham radio operator but are thinking
of getting your "ticket", you are encouraged to explore via this
FAQ and the WWW sites it LINKS to and get a sense of how
t o t a l l y neat amateur radio is. After all,
amateur radio IS the first wireless Internet!

You only stand to GAIN - in technical knowledge, operating
skills, new friendships all over the world, and a sense of pride
and accomplishment in earning your license, assembling, and
operating YOUR very own station.

Please provide the URL the Ham Radio.FAQ to any new or soon-to-be
Hams that you know or create a link from your site to us to help
pass the word.

http://www.mv.com/ipusers/wd1v/hamradio.faq.html

Your suggestions, corrections, ideas, and assistance are
appreciated!

I live within driving distance of Henry, and have done a bit of business with
him....

He built two repeaters for me, a 2 meter and a 440 mhz... both worked well.
He has built repeaters for a couple of friends, all work well...

I have seen his work and what I have seen is of high quality....

I wouldn't hesitate dealing with him again...

Of course, this is MY opinion, and someone else's may be different....

I suggest you continue to ask around.

[Talking about power MOSFETs]

> I didn't see any max frequency listed though.

I believe this is because the FETs aren't intended for use
as an RF amplifier. They're switches, and are specified for
turn-on delay and turn-on delay; if you add these two parameters
together and take the reciprocal, you can estimate the maximum
frequency at which the FET will full switch from one state to
the other, perhaps interesting if you're building a class D
amplifier. Even so, class AB operation will be successful well
in excess of the switching-frequency.

Note that switching time is dependent on the gate drive impedance,
lower is better. I usually load the gate with a fairly small
resistance (say 12.5 ohms), then attempt to match the input
driver (50 ohm) to that (a lot of fun, since the reactive gate is
in parallel). I estimate gate capacitance using the total Q (charge)
figures given in the datasheet.

DO NOT USE SOLDER PASTE!!!!!!!!!! Never!!! You can use a jewlers hood and
a weller micro iron, if you are careful. Forget the oven idea as well. A
Haaco hot air station is the prefered method for both removal and
replacement. Even then you need experience with the unit or you'll blow
other components off the board, or blister the board. I repair camcorders
for a living, and replace flat pack IC's for a living. Take my word for it.

Source record: 76446

Doug DeMaw, W1FB, says " PVC tubing should not be used as
the main coil form, owing to its poor RF properties" (QST, Feb.
1987, pag 22) and "Phenolic or fiberglass tubing is suggested for
the coil-form material, but PVC tubing can be used if the SWR in
the system is maintained below 2:1 at he higher power levels. PVC
tubing will heat and burn when subjected to high values of rf voltage
in the hf spectrum." (Hints and Kinks, ARRL,11th ed., 1982, pag.
5.10)

I wanted to know the reason for those statements and sent an
inquiry to some list. Someone replied it was a misinterpretation by
the author of a smoke result due to ohmic heating for a coil he
built, and said that PVC is ok for coil forms.

Another mentioned the microwave oven test. I did it whit a small
PVC tube, and indeed it did not warm in a couple of minutes.

I found the next in Electric Materials, Bogorodiski et al., Mir,
Moscow:

PVC is a polar compound, polyethylene is not.

For PVC, tg(delta) 0.03 to 0.08
polyethylene, tg(delta) 0.0001 to 0.0005

Polar molecules are heated by microwaves, thus PVC could be by
frequencies in the hf spectrum.

Perhaps the best way to compare materials for coil forms is with
their hysteresis curves, available only for core materials.

If a capacitor were made with PVC as dielectric, 3 to 8% of the
energy would be lost as heat, whereas for polyethylene 0.01 to
0.05%. This is using the data from Bogodiski et al.

3/0.01= 300 times!

8/0.05= 160 times!

delta is the complement of phi, and cos(phi) is the power factor.

Any remark is welcome.

Not sure if this is exactly what you guys are talking about,
but there exists a shareware library "vbasm.dll" that puts
back into visual basic, all the stuff that you could do
with quick basic: peek, poke, inp, out, etc.
Don't know if it relates to NT. I've used it with Win95.
I believe it will allow you to execute programs that trash the system.
That's usually not a good thing.

5137. Re: Want: Info on cable hardline matching xfmrs

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-27 00:00:00 UTC
From: km6ce@aol.com
Message-ID: <19981127010010.21368.00001224@ng20.aol.com>
Source record: 76448

hi mike,, re your 70 ohm cable coax to 50 ohm.
you called it 70 ohn 7/8 in, suspect its 75 ohm cable really.

i also have some 7/8 75 ohm cable coax, seems to be great stuff, mine is new.

several ways to convert 75 oms to 50 ohms, most depend on the freq band you
want to use cable for.

the most broadband way is with toroid xfmrs,
wounf to convert 50-75\ 75-50 ohms. these are neat and broadband, however to
get them to handle power at vhf/uhf freq is very difficult as core mass = power
snd also makes wire used longer, more capacity, inductance, ets, so wideband
power toroids at uhf not too good.

several narrow band (+-15%) methods are easily made,
one is a 1/4 wave piece of 62 ohm coax,

another is the dual 1/12 wave coax line
---works like this:
from 50 ohm port, conect a 1/12 wl of 75 ohm coax, then add a 1/12 wl of 50 ohm
coax, which then connects to the 75 port.. ie::
50 line, 1/12 75 ohm, 1/12 50 ohm, 75 ohm line

both of these can be made easy if you use
PC board stripline technique.
(also is shorter, as pc board velocity of propogation is about 2/3 of coax.,
and coax is 2/3 of air.
ie, pc trace is about 1/2 of wavelength in air.

coax connectors for 7/8 cable coax can be made from copper pipe ends as shield
/ shell,
and standard coax fittings
(type N for 9913 coax is best)

5138. Re: Transceiver as a repeater

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-27 00:00:00 UTC
From: km6ce@aol.com
Message-ID: <19981127011314.21368.00001226@ng20.aol.com>
Source record: 76449

yes, SOME transceivers csn be made to function as repeater rx and tx.

this would most likely be older crystal units, not the newer pll units.

several had seperate receiver board and xtal oscillator for rx freq, this has
own seperate rf, if, audio, etc/

and seperate tx bpard with its own tx freq oscillator, these have own seperate
audio, if, rf .
all that is required is to simultainously power both rx and tx, connect rx
audio out/ tx audio in together, use rx squelch /signal present indicator line
to "key" or turn on transmitter,
and connect rx and tx antenna i/o to a good cavity duplexer, which provides the
isolation and rejection to keep tx signal out of rx input.

Using the newer radio fails mostly because so much of radio is common to rx and
tx,
typically arounfd the IF is where the newer ones becom common and
bi-directional, which is why that type would not work.

Gary was right. DOS is a program loader. But, IMHO, not a very good one.

As an alternative you might consider using an operating system. DOS isn't one,
despite many assertions to the contrary.

>DO NOT USE SOLDER PASTE!!!!!!!!!! Never!!!

Why? Pray tell ... solder paste and reflow soldering are the industry
standard method of soldering today ... especially, but not exclusively,
for SMT components.

However, one should ALWAYS be careful with the solder paste,
avoid rubbing one's eyes or sucking on one's fingers while using
solder paste, and ALWAYS wash one's hands thoroughly after using
solder paste.

As long as one uses those simple precautions, I don't understand
the "basis" for your ridiculous admonition to "never use solder paste."

> 0.05%. This is using the data from Bogodiski et al. . .

The amount of loss in a capacitor isn't simply equal to the dissipation factor, but is a function of the energy stored in the capacitor relative to the energy used in the circuit. A lossy capacitor can be used in a low-Q circuit without dissipating a significant fraction of the energy applied to the circuit. But the same capacitor used in a high-Q circuit can dissipate most of the applied energy. Consequently, the effect of using a lossy dielectric in a coil depends on the coil's application.

Another thing to consider is that only a part of a coil's electric field is in the dielectric of the form. So only part of the field is subject to its loss. Consequently, the loss is considerably less than it would be for a capacitor, where a larger fraction of the field is in the dielectric.

I wouldn't use PVC as a form for a VFO tank inductor, because even a very small amount of inductor loss would reduce performance. However, there are many applications where the relatively small amount of loss caused by a PVC form won't noticeably affect circuit or system operation.

==========
There are a number of 144 / 440 MHz dual band FM transceivers which,
with a dual band antenna, can be happily used as a cross-band repeater .
Alinco is one make which springs to mind.

There are program loaders that are not operating systems, such as the BIOS boot loader (which is a very rudimentary program loader) or various system image loaders in various distributed systems.

On the other hand there are operating systems that are not capable of loading new programs, EPROM based embedded systems doing multitasking, perhaps with a command interpreter, possibly even memory protection, but still knowing noting about mass storage peripherals or file systems.

If you contemplate this, try running the machine for hours at a time.
Measure the heatsink temperature.
One of the first things the local repeater jammers will try is to lock
it up in the on position. Typical ham transceiver won't last long
in continuous transmit.
There are also some control issues. Make sure you can always shut
it down no matter what the jammers try to do.

It's not unusual to find a box of dead transceivers at hamfests.
I bought a box of u12 handhelds once for $5. Some would only
transmit, some only receive. Voila, a repeater...well, it's not quite
that simple, you need to design the controller, duplexers, metal shield
boxes, get a bunch of feedthrus... but when you're done it's a real
repeater.

If you cant get hold of a transformer and you have no other choices you could dismantle it counting the number of turns as you go (also making lots of notes) and re-wind it yourself. I did this with a Gould / Advance 40 MHz scope where the main power transformer developed a short in the primary.

It took many hours but it can be done if you really want to get the unit working
and there are no other choices - a last resort. Its still working fine 5 years on.

>Mitch AE4YW

Well, I repair $35,000 camcorders (professional ENG equipment) among other things, so I can speak from experience too. Solder paste is *the* standard way to mount SMT parts. A static hot air source, the Weller Pyropen Jr is a good inexpensive one, is *the* way to install and remove SMT parts. Irons and roll solder should never be used for SMT work. They're nothing but a source of endless frustration.

Proper SMT rework is an art that must be mastered. It requires different techniques from those used on thru-hole leaded parts. But those techniques are not hard to master, and they give consistently good results once you've mastered them.

If you are blowing parts around and blistering boards, you don't have your static hot air source adjusted correctly, and you're probably taking way too long to install or remove components. Speed is essential when working with these small parts. No more than one or two seconds of heat should be sufficient to remove or install SMT devices. You have to have the proper shrouds for the job so that you get quick even heat flow without excessive flow velocity. If you apply the proper amount of solder paste to each pad, when you apply heat, the part will self-align on the pads due to surface tension. You should never have to hold a part in place manually. If you find that you do, you're doing something wrong.

The solder paste that you use has to be fresh. This stuff doesn't have a long shelf life. It'll keep in a refrigerator up to about 6 months, but if you keep it on the bench, you have to use it up in a week or so. Stale paste will give you solder balls. The pads should be clean before you apply the paste (Solderwick is good for cleaning the pads). Use a wooden toothpick to apply the paste, and use just the tiniest amount on each pad. The most common mistake with paste is using too much.

Set your part roughly in place with fine tweezers, and *let go*. Now apply static hot air. When you see the part pull into alignment, remove the static hot air source. Let cool. Done. If you are working on a very densely packed board, you may want to apply a bit of modeling clay over adjacent parts to avoid unsoldering them with the hot air source. The clay will peel off easily when you are done and can be reused.

Keep it in an air tight container when not in use.

A good jeweler's loupe and a strong light are essential to SMT work.
A pair of shot bags on which to rest your wrists are also very handy.
This makes your hands *much* steadier, and allows you to do very
fine work. You don't need a mechanical stage or a microscope. While
those things are nice in a production environment, in a repair environment
it takes longer to strip the unit so you can mount it on the stage than it
would take to just go ahead and repair it in situ with handheld tooling.

I pride myself on the fact that you can't tell which component I replaced
when the job is done. It all looks like factory work. You can do that every
time once you master the proper techniques. I much prefer working with
SMT than working with thru-hole leaded parts, or shudder, with point to
point wiring.

The message <73pt7jhbc1@newsreader2.core.theplanet.net>
from "John Mortlock" <jmort@global.freeserve.co.uk> contains these words:

> If you cant get hold of a transformer and you have no other choices you
> could dismantle it counting the number of turns as you go (also making
> lots of notes) and re-wind it yourself.

I thought of doing that but the idea of all that work did not appeal
to this senile person<GG>

There is the option of getting it rewound but the cost looks VERY prohibitive.

thanks for your suggestion,

Glen G8MWR

First, if there is a local ham club, they will probably be very helpful
in getting you started.

Second, unless you have a lot of disposable income, the all-in-one units
are very pricey. Get your hands on the ARRL handbook, cruise the web,
and see if you can narrow the field down.

2M, and less so, 440 mhz, is the popular place to start with the no-code
Tech license. HF operation, with a few exceptions, will require Morse
code skills, bulkier antennas, and can be more daunting to the beginner.
It is however, an easier target for homebrew equipment.

Don't get into VHF/UHF. Study for the tests and take them all. You have to pass all of them in order of ranking. Morse code is where the you'll have work. The lowest ranked test will get you full usage of the VHF/UHF bands but don't go there until you have the HF rating and gear. I say again.... Don't get into that band until you have HF gear. You could end up spending and spending money on gear once you start buying so make sure you start in the HF department. Plus some VHF/UHF friends developed might tell you HF is for old farts. These are primarily guys who don't have a brain to start with and can't coordinate there thought process with their body to copy Morse code anyway so stay away from them. Wattage isn't always important in HF but it is the life or death of a signal that isn't going very far in VHF anyway. Unless you are working satellites then your range is still limited. Find a file to download called Wisp32-2.EXE where the -2 depends on your OS. Then get your keps from http://celestrak.com/NORAD/elements/index.html or http://www.ncdc.noaa.gov/ol/satellite/satelliteresources.html . You have to wait for the
satellite. Yah right. But, once again stay out of there until you have HF gear. Start with used gear like probably 95% of everyone started with then decide where you want to go. If you are rich just start with a Ten-Tec top of the line and mess it up from not knowing how to operate it then buy another. It's American and quieter then any transistor rig around. That's the new top of the line ones. Priorities are HF rating, Radio, Coax, Antenna. RG-8 coax falls apart. Buy a variety called RG-213 at a minimum. Go HF. You'll be able to talk to Europe when VHF wont go across the city
By the way. Would this be from talking to a VHFer, "... I've received the impression that some of the more
'experienced' radio operators have little patience for newbies," or are you just talking to other New Yorkers in the Syracuse University area. Good luck.
Jim AH6OY

>intel progamming module to use. no specific programming data is listed.

The '79 Intel databook says that you pulse Vdd (pin 5?) to 25 volts for
50 milliseconds. CE/PGM is raised 2 microseconds or more before and
dropped 2 microseconds or more after Vdd is pulsed. Rise and Fall
times of Vdd are an additional 2 microseconds.

Try starting with a simple homebrew receiver. The components
are a dime, a dozen. As you subscribe to this NG, you obviously
have an interest in homebrew radio.

Once you have heard those weak signals from the other side of
the world, you'll be hooked for life.

Hi folks

If I haven't told you, I have started a service for hams. It includes free e-mail. If you would like to go check it out I would appreciate it. I would also REALLY appreciate if everyone would sign up for at least a free e-mail account. I am trying to get all hams to get a FREE E-MAIL address from Ham's net. This is for Ham Operators only

Wouldn't it be nice to be able to send e-mail to any ham you know and only have to know one address "hamsnet.net" Plus if you ever change ISP's you wouldn't have to change your e-mail address

I think you will like the idea behind the site anyway.

>zcolt@hotmail.com

Brett,

My son Todd (N4WOR), did 6 years of antenna projects starting in 7th Grade and finishing as a senior in high school. Along the way, he went to six state science fairs and two international ones.

Antennas are good projects because they are within the skill range of the students, allow the collection of lots of data (a must to be competive), and can be understood by the judges (electronics are generally a turnoff by the judges.

For example, Todd built a near field, azmulthal protractor from PVC pipe and took field strength readings over 180 degree field (every ten degrees). He did this first with copper antennas and later with superconductor ones (all types -dipoles, yagis, loops, helicals). Along the way these efforts lead to 3 technical presentations at engineering society meetings or the Defense Advanced Research Projects Agency.

As an initial ideal, your kids could show the effect of director or reflector number, spacing, or size on the field strength of a "rope ladder yagi", explore antenna type and configurations over multiple paths or with a HAMSAT satellite,show the effect of cross polarization, and maybe even make a crude radio telescope with different antennas.

One of the keys to getting the kids interest up is talking to other hams and also professors in the EE dept.of your college. Watch out for the later case - some of these guys have an ego and cannot be bothered "with kids play". I would meet the professor first before bringing the kids, BUT if he is helpful, you will get ideas and resources for a really competitive project where the kids will learn the scientific method from a pro.

Hope this helps.

DE WA3SGZ

Les

email: wa3sgz@magicnet.net

P.S. Timing is bad because competitive projects need to start in Sept. Also, don't use flimsy cardboard backdrop. Use painted masonite or thin plywood. Also, each state conforms to the international rules, so be sure you know the exact sizes.

When I first started making coax traps (where the coil is made from
coax around pvc pipe)I found what your experencing to be correct. to
tune the trap I added about 18inches of wire on either end of the trap
then used the grid dipper. The resultant freq as seen by the dipper
was what was seen when the trap was installed.

5198. help Program Basic Stamp2 for Ham Radio

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-29 00:00:00 UTC
From: dbh_prod@ix.netcom.com
Message-ID: <73se57oka1@nnrp1.dejanews.com>
Source record: 76504
Cross-posted to: rec.radio.amateur.homebrew,comp.arch.embedded,sci.electronics.design,sci.electronics.basics

OK, so this is what I need Basic stamp2 programming help on. Maybe one of you experts could write the program for me. Or at least tell me how the serin command works. I cant seem to figure out how to set the stamp to receive 1200 baud.

I have an ACC RC-85 repeater Controller for ham radio. This device outputs a TTL serial signal out of the CX1 connection to options including a DRV board. The serial stream sends data at 1200 baud 8 N 1. This calls up individual tracks on the ACC-DVR. The actual output looks like this: "p1" - this is a request to play track 1 "p2" - for track 2 and so on.

The ACC DVR board is no longer available. I am now trying to use the Ming - 58A DVR board. This board feature 16 tracks over 2.5 minutes of 32k-bit audio, Perfect for my needs. To access these tracks I need to select one of sixteen tracks thought the use of a binary selection header. Basically to use this board you select a message by applying and holding a logic high to the appropriate binary selection header pins and then applying a monentary logic high to the play pin the DVR board. This starts the play sequence of the selected DVR track. The DVR board supplies logic high to indicate a busy to the RC-85 board.

To make this all happen I have elected to use the Basic stamp2 as the controlling interface. The theory of operation would be that the controller sends a serial stream to the Basic Stamp. The Basic Stamp would make high the approaite pins that are connected to the DVR boards binary selection header pins selecting a track of audio to be played and then making another pin high to play the selected track. The DVR board would be responsible for holding controllers busy until the track play was completed

To make a short story long and complicated, I need help with the program. I picked pin 7 for the play button and pins 1,2,3 and 4 as the binary selection pin outputs. I have selected pin 15 as the serial in pin. I have the PC setup to download the program and monitor the stamp though debug. I am far from a programmer and any help would be greatly apperatated.

Our club's 2m transceiver used for the Packet BBS , has a low output (only 3 W instead of the usual 40 W.
TX current at 13.8V is also low (only 3 Amperes) .It could be a defective Misubishi M57726 PA module or perhaps a PIN diode problem .
Another possibility is too low drive.
Note : When reducing the supply voltage to 11 Volts the RF output increases to 4.5 Watts

Since we don't have the circuit diagramme , we would very much appreciate receiving a copy of the diagramme Any cost incurred will be refunded.

Does anyone know of any diagram, instructions, and material list for assembling by myself a telephone restrictor, the simplest kind, for preventing outgoing or incoming calls from pushing through without entering a code number. Maybe someone among you know of a way to do it without assembling anything. There are such devices in the market, but if I can assemble it myself, why not?
Thanks.

Take a look at the source code for my basic stamp remote control project which
was in the May issue of QST. The source code is available on the ARRL's ftp
site:

ftp://ftp.arrl.org/pub/qst-binaries/

look for the file called 706stamp.zip. That program is designed to take binary information from a DTMF chip and send and receive serial data to/from an Icom 706. In principle, at least, you are doing something similar. What you have in mind here is fairly simple on a basic stamp. It could be done even more cheaply on a PIC (about $6), but writing the code would be harder.

Good luck with your project. If you run into any specfic problems drop me a note at hansen@cs.fredonia.edu.

<SNIP!>

I agree with most of what Gary has to say here (no, I don't repair SMT boards for a living, I just design & re-work 'em). Hot air is *THE* way to go, but I don't agree that irons should *never* be used. True, the iron you get down at Radio Shack will be horribly inadequate and, most likely, a disaster. I use a Metcal iron with a really tiny tip (and a binocular microscope). Metcal irons are designed for SMT work and use RF to heat the tip. They ain't cheap though, about $450 plus around $30 for each tip.

I don't know what the hot air systems go for, but I've seen Metcal's for sale at a few surplus places for around $75 to $100. For the hobbyist, this gets a viable SMT soldering system down to a reasonably affordable level. However, SMT work is probably not for the average person who solders once in a blue moon. It requires steady hands, practice, and, almost always magnification to really see what you're doing.

Hi Jeff. Well, there are few things we need to know:
1) Are you using a resistor directly connected to the RS232 serial data, or
is it TTL, or do you have a line driver like a MAX232?

2) Does the device require any handshaking?

The Stamp has to sit and wait for serial data and while it is waiting
nothing else happens (well, you can timeout if you want).

You ought to have something like:

```
byt1 var BYTE
byt2 var BYTE

SERIN 15, XXXX, [byt1,byt2...]
```

XXXX will be either 17197 or 813 depending on the connection you have and if
it is RS232 or TTL.

By the way, you can read alot about the Stamp (including our solderless
prototyping for Stamps), and ham radio at http://www.al-williams.com/wd5gnr

73,

Al Williams

5217. Hamcomm decoder or soundcard software? Nec Versa M/75

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-30 00:00:00 UTC
From: The Crew <dc@citynet.net>

Hi,

I have a NEC Versa M/75 notebook and am having trouble finding software/freeware/shareware that will acknowledge the soundcard, and being the inept one that i am, have also not had much luck by changing the irq's, etc. some software works, some doesn't. It is a built in card with windows drivers, which emulates soundblaster. I'm trying to run things like ACARS decoder, POCSAG decoder, SSTV and RTTY decoders..... am I wasting my time trying to make the "soundcard-type software" work?? Should I just order that HamComm serial port decoder and be done with it? (it do seem to have a lot more software avail.) also, anyone with input on the usefulness and operation of your hamcomm decoder, please feel free to input! Can it be used with a spectrum analyzer program?
thanks for the time and please email replies!
Randy

5218. FS: SMA connectors

allent@multimeg.net (Dave Allen) writes:
>Looking for an reliable automotive tachometer circuit, possibly to be
>used in conjunction with a digital multimeter.

Radio-Electronics magazine (formerly called Radio Craft and then
Radio and TV News) used to carry homebrew articles for automobile
instruments. I recently acquired, "read", and tore-out a four-inch-
high stack of articles interesting to me from an almost complete set
dating from the early '40's through the early '70's. I haven't had
time yet to sort and file the articles, but here are some I found
just thumbing through the pile:

June '68 "Build Low Cost Solid-State Tach-Dwell Voltmeter" (pp 44 ff)
June '69 "Build For Your Car--One-IC Tachometer" (pp 52 ff)
Apr. '70 "Tune Up Your Car With A VOM" (pp 23 ff)
and "Build Solid-State Tach & Add-on Speed Alarm" (pp 33 ff)
Aug. '71 "Use a VOM as a Dwell Meter" (page 75)

I'm pretty sure there were others, but I'll let you have the fun
of looking through some old magazines!

5226. Re: TS-440SAT OUT OF BAND

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-30 00:00:00 UTC
From: mcalhoun@ksu.edu
Message-ID: <73vmot$6f@fox.ksu.ksu.edu>
Source record: 76387

"William H. Phinizy" <wphinizy@connect3.com> writes:
>Does anyone know where i can find the mod to make a TS-440SAT transmit out
>of band? ....

Snipped from Gordon West's "Kenwood 440 Modifications" printed in
"Popular Communications" of October, 1987, p. 62:

"Remove 17 screws holding on the bottom and top covers....

"Gain access to the front of the unit by removing ....

"Remove the shiny silver control board protection plate....

"Locate diode D-80 in the bottom left-hand corner.
Snip it for all-band transmit.
....
"Carefully reassemble....

" Connect power. Depress A+B switch and turn on the power simul...."

Take care; such modifications undoubtedly void whatever warranty might
remain. Modification might not even work--your mileage may vary.

I found the above on the Internet some years ago and haven't tried it
on my '440 yet, but your posting now gives me a reason!

The center pin is soldered (or crimped, not sure) and the shield is
crimped, a piece of heat shink goes over the crimp. They are made of
brass. I have 56 connectors available, possibly more in storage. While
going through the box, I found a female SMA chassis mount connector with a
long center pin on the inside of the chassis portion.

I think that connectors fit RG-214. That is, coax around RG-58 size. I'm
not too sure about microwave coax numbers because I mainly use hardlines
at work.

5228. new voice keyer

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-11-30 00:00:00 UTC
From: Stu Olson <solson@usa.net>
Message-ID: <73vqehhqc1@fir.prod.itd.earthlink.net>
Source record: 76389

If you are not happy with the current offering of software voice keyers, how about one that was designed from the ground up with MS operators, contesters, and just plain ragchewing in mind! If your PC has a Windows compatible sound card, its time you try this digital voice keyer. (Heck, one of the users even figured out how to do MS CW skeds with it.)

After some intense development effort, VoiceKeyExpress, the newest digital voice keyer, is now available.

Check out http://home.earthlink.net/~n7qjp for the details. You'll be glad you did!

Select the VoiceKeyExpress link from this page to view the user manual, FAQ page, and download page.

Hope you enjoy it, just in time for the next meteor shower!

Source record: 76391

Hello Jim,

It is too bad I am no longer with W. L. Gore; I could have gotten all the scrap PTFE the Boatanchor group could have ever needed!

Do NOT use the suggestion of acetate sheet. While it can take the temperature of a fusing roll on a laser printer, it has lousy dielectric properties. A six meters, I would expect it to ignite in a very high electric field. Mylar, or PET, will handle the RF environment but its temperature rating is slightly less than 100 C. Very thin fiberglass filled polyester sheet would work well if flexible enough. If your dimensions are finalized, you could make a custom tube from fiberglass cloth and boat resin. Use some PTFE plumber's tape on the ends to seal it.

Barry L. Ornitz WA4VZQ ornitz@dpnet.net

Side note: I have now worked for companies making cellulose acetate, polyethylene terephthalate, and polytetrafluoroethylene, polyethylene, polypropylene, and scads of specialty plastics. I wonder what is next?

I have discovered that most matching methods introduce more loss than living with the slight mismatch.

5236. Help: 220/2m Duplexer-combiner

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-12-01 00:00:00 UTC
From: ak2f@my-dejanews.com
Message-ID: <741cik$r6l$1@nnrp1.dejanews.com>
Source record: 76312
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew

Thank you for reading. I would like to homebrew a "duplexer" to combine the 144 and 220 MHz outputs from my mobile rig into a homebrew dual band antenna. Anyone have any good circuits for making a duplexer network? Thought I saw one a while back. My guess would be a low pass pi net for 144 coupled to a 220 hi pass pi net. Second guess would be "coupled resonator" filters for each band.

> > Anyone else still messing around with the R2 plus
> > the Motorola 56k DSP evaluation board?

I've been using one as a KISS-only TNC. Last night I hooked it
up to the MacAPRS beta (which has KISS support and was able to
capture the local traffic along with the gatewayed HF traffic.

I've been thinking of trying to modify the code to make a
stand alone APRS tracker, but the code it awfully intimidating...
Plan B (a microcontroller that watches the GPS strings and then
periodically puts together the KISS data to send an APRS packet)
seems increasingly the more attractive.

Yes! This is an often overlooked source. The price is pretty reasonable,
and you can lay the strips down on plain ciruit board to make cut and paste
PC boards.

Hi all,

I'm in need of about 25 small printed-circuit power transformers. Ideal would be the common split-primary, split-secondary type, about 1 to 2 VA, 120/120 input at 60Hz, 6.3/6.3 or 8/8 or even 10/10 out. I do need 240V input, and could live with only 240V but would prefer split (or even centertapped) primaries to accomodate both 120 and 240. 2"x2" board area would be the absolute maximum, and smaller would be better.

Anyone have a lead on getting these cheap? Yes, DigiKey has them, at about $6.80 each. I'm hoping for some clean surplus at maybe $1.50 or $2 each, or a donation. This is for a project I'm doing for charity, so keeping the cost down is key. All Electronics in So.CA had some in a catalog a year ago that would have been ideal in all respects, but of course they don't have them now, and what they do have is more expensive, larger, and on the high end of the acceptable voltage range.

Hello, I'm a newbie to this group. I hope you'll forgive my slightly off-topic posting here, but I figured if anyone could answer my questions, you radio homebrew guys could.

I have a 900 MHz spread spectrum cordless phone that I really like a lot. The spread-spectrum feature is nice for keeping the average joe from listening in on my phone calls. :-)

Anyway, this little phone (which I adore), has one of those little rubber membrane type keypads on it. Many of the buttons have stopped functioning on the phone. When I disassembled the phone, I saw that there were no traditional contact switches, but instead were only exposed portions of a printed circuit board. When part of the membrane (a small black surface resembling graphite) touched these exposed contacts, it closed the "switch".

There did not appear to be anything wrong with either the board, or the rubber membranes. So why is my phone not working?

I did notice that there was some jelly-like goo covering the back of the rubber membrane. I assumed that this was some sort of contact grease, so I left it as it was.

Do you suppose that I could repair my phone if I were to go to Radio Shack and get a tube of that contact-grease stuff and rub it on the black parts of the membrane (the part that makes contact with the circuit board)? Or, am I just out of luck because I bought a cheap phone?

Thanks for any suggestions you can offer.

Ethan OM,

I suggest you borrow an HF receiver if you can, for starters. Stay
away from
VHF/UHF FM, as it is only local activity, usually non-technical in
nature, and
you won't learn much about how things actually work. When you hear
signals from
far-away places, reaching your ears with no other infrastructure
involved except
the ionosphere, you may get hooked! I hope you do, because this for me
is the
essence of ham radio. Learn the code as early as you can, and listen to
the
activity on CW. You will hear more interesting stuff that way too,
even using simple equipment that you can build yourself, which is the
reason
for this newsgroup.
73 and GL (Good Luck),

Don, W6JL

My newest spreaders are made of 1/2 thick Lexon cut into strips 1/2 inch wide cut to 6" lengths. I drill two holes in each end - one for the feedline and the other for the wrap that holds the feedline in place at each insulator.

These spreaders are heavier than the old Johnson jobs, but they work. If you want less weight - try using Lexon or Plexiglas tubing.

Sometimes you might get lucky at a plastics distributor and get scraps for free.

Clean off the jelly-like goo and reassemble your phone, and you'll
probably find it's OK. For awhile. It is not clear just where that
jelly-like goo comes from, but all of my 900 MHz phones have suffered
from the same problem, and a look through dejanews will reveal many
similar complaints.

I would agree with this 98% of the time. On the other hand, some areas
like Seattle/Portland, the Bay, or to a lesser extend, LA, have very
technically oriented people on the VHF/UHF bands, and many of the HF
bands are occupied by
aging operators discussing the weather and their health.

Ham radio is a big place; treat it like a smorgabord, and when you find
something to your personal taste, go back for more.

The answer is yes! The Hamcomm interface will operate many modes, including a few you did not mention - Hellschreiber (Feld-Hell), HFFAX, SSTV.

It is really easy to build a Hamcomm interface. I suggest you check http://www.accessone.com/~tmayhan/ for details.

For info on Hellschreiber, which is gaining a renewed interest the world over, check http://members.xoom.com/ZL1BPU/Contents.html

The Hamcomm softwaare includes a simple spectruim display.

73,

fred

Hello, as promised I'd come through with more complete,
original, good to excellent condition Antique electronic
and audio catalogs/sales brochures.
All are as represented, ALL SALES FINAL on literature.
Prices below are firm, and INCLUDE SHIPPING to anywhere
in the lower 48 U.S. states. Others by quote. Some of
these catalogs have stuff YOU ONLY CAN DREAM ABOUT...
Thanks, first come, first served ! You will enjoy these.....
Please send your orders via Email to : Tubelit@aol.com
If you need TUBES, please respond to Tubecntral@aol.com
HAPPY HOLIDAYS TO ALL !!!
Regards, Joe Pratt

THIS IS WHAT IS HERE RIGHT NOW:

ADR audio catalog, looks like earlt-mid 70's, 7 pages, 5.00

ARRL callbook, foriegn edition, 1983, 10.00

ARRL callbook, US edition, 1984, 10.00

Audio warehouse catalog, Vol. ! Issue 2, looks like early-mid
70's, 8 pages, 5.00

Allied's supplement #133 to 1953 cat.#131, 48 pgs.
of the good stuff, tiny fold in one corner, but nice! 25.00

Allied's "festival of values" supplement # 182, 1958
100% complete, good shape 48 pgs, 20.00

Allied's winter sale catalog # 263, 1966, 89 pages in excellent shape,
includes all the Knight kits and order form, 25.00

The "Audio Exchange's audio fair 1955 edition, comes with extra
fold-out equipment flyers,nice condition! 8 pages plus 3 flyers, 10.00

"The care and feeding of power tetrodes" original mint condition,
Eitel McCollough's rare (these days) guide to running the big stuff!
Well illustrated, 25 pages, 29.00

Federated purchaser's 1956 catalog supplement for "High fidelity
sound equipment",a fold-out single page type, nice condition,
10.00 ea., have 2 identical in same condition!

Federated purchaser 1960 catalog , 303 pages in nice shape, but
page 1 has some writing, has small hole in the last 6 pages,
but real cool.. lists Genelex KT-66's for 3.50 ea.!!
Try getting that deal these days! 22.00

"Heathkits for 1955" catalog, nice shape except a couple small stains on cover,100% complete! 47 pages, 30.00

Heathkit 1956 fall flyer, near mint cond, 7 pages and order form, 15.00

"Heathkits for 1957" catalog, excellent save for a little stain on cover, 100% there, 55 pages, 30.00

"Heathkits for 1958", This is THE one! All the TX's are here! near mint cond, 57 pages, 32.00

Heathkit 1959 catalog, near mint, shows the W-5M kit for 59.75 !!! 100% complete, RARE....30.00

Heathkit 1961 catalog, 100% there in NICE shape, 66 pages, 25.00

Heath catalog,July, 1961, very nice cond. w/order form, 39 pages, 20.00

Heath catalog, Fall/winter 1961/62, Small tear on cover, and cover loose, but 99% there,missing order form, 99 pages, 20.00

Heath catalog, #810-50, 106 pages, very nice, 30.00

"Give a Heathkit" for Christmas, catalog supplement 80/31, Oct. 1962, 100% there, but cover is loose and worn, but OK looking,47 pages,15.00

H.W. Sams co. 1984 Photofact anual index, 208 pages, very nice, 19.00

H.W. Sams co. 1985 Photofact anual index, 216 pages, very nice, 19.00

Hudson Hi-fidelity catalog, 1958, 62 pages, all the goodies! great shape, 19.00

Key Electronics, Inc. 1963 audio discount cat# A-17, 20 pages, very nice shape and very interesting, 15.00

Lafayette Cat.# 740, 1974, 473 pgs. includes order forms, real nice,but missing a bit of writing on the spine, 100% there, 12.00

Lafayette Cat.# 743, 111 pages, cover a little loose, but nice, 100% there! 7.00

MusiCraft special flyer, icludes schematic for the 60 watt 6550 audio amp! Looks like 50's or early 60's, comes with free extra, different copy, 10.00

The NEW YORK TIMES, Sunday, March 15, 1959 Hi-Fi- stereo special section 10! RARE RARE RARE in fairly good shape, but yellowed, of course. 15 full size newspaper pages, has been folded since 1959, REAL COOL STUFF 20.00

Radio Shack "newspaper type" catalog, # 117, Jan/Feb 1962, "Annual mid-winter sale",near mint except for one small, tiny tear, 40 pgs., 25.00

Sound reproduction inc, E. Orange, N.J. catalog # 50, 1977, 16 pages, 5.00

Terminal Radio Corp's 1959 high-fidelity 'Audio Digest"
catalog, straight from "Radio Row"
on Cortlandt street in NYC, 90 pages CRAMMED
full of dreamy items, rare and in nice
shape, 29.00

Zalytron catalog # 161, lotsa audio goodies! Nice shape,
a couple of small tears, tube info inside, too! 91 pages, looks like
early to mid fifty's, 19.00

Thanks to all, I'll post more as I find 'em!

Hello, I have the following Western Electric tubes in stock and ready
to go. All are NOS (new old stock) in the original boxes unless stated
otherwise. All are tested on the Hickok TV-7D/U to insure quality.
Where there is a used tube, I've provided the TV-7 readings as follows:
M= minimum acceptable for good tubes
T= this tube's readings.
These are all of the W.E. that I currently have in stock. I also have
a huge inventory of other types of NOS and TV-7 checked tubes. Inquire.
Shipping and optional insurance extra. Thanks, Read on.....
Joe Pratt
Tubecntral@aol.com

M= minimum on TV-7, T= This particular tube's reading

102F "tennis ball" triode, ONE with perfect getter, tests good,
M=25, T=25.... 75.00

313C, TWO @ 3.00 ea.
352A, may be used, but tests NOS, Triode M=16, T=29
Diodes, m=40, t=56,56....20.00
395A, ONE @ 10.00
395A, TWO NOS but reboxed, 9.00 ea.
396A (2C51)...NINE @ 7.00 ea.
396A USED, NINE @ 3.50 ea.
JW 2C51, ONE @ 7.00
2K56/397A, One reboxed NOS @ 20.00
401A, EIGHT @ 3.00 ea.
403A,(6AK5) NINE @ 3.50 ea.
403B,(6AK5) (reduced filiment draw for longer life),FORTY-SIX @ 4.00 ea.
6AK5, FIVE @ 4.00 ea.

I wouldn't be quite so pessimistic, but would try it. Losses in the chimney depend very much on the field gradient - the *change* in electric field through the thickness - and that is quite difficult to predict in advance.

Use the thinnest sheet that will work, to reduce the energy lost within the thickness of the material and also to improve the air cooling.

Start carefully, just tapping the key briefly, and work up to full power and full duty cycle. With care you should be able to detect any problem well in advance of catching fire (and even that wouldn't be a disaster if you're ready to switch off quickly).

>Mylar, or PET, will handle the RF environment but its
>temperature rating is slightly less than 100 C. Very thin fiberglass
>filled polyester sheet would work well if flexible enough. If your
>dimensions are finalized, you could make a custom tube from fiberglass
>cloth and boat resin.

It's probably easier to find PTFE sheet.

But do make sure it really *is* PTFE! There are many white, smooth plastics that look a lot like PTFE (and may even be chemically related) but they don't have that unique combination of good RF properties and good high-temperature performance. There are lots of stories about people who have been given or sold such materials in all good faith, and then wondered why they melted...

>Use some PTFE plumber's tape on the ends to seal it.
>
Thin brown Mylar parcel tape is excellent for this job.

I just bought an ADSP-2181 eval board and will be messing with
it over the holidays. Hooking it up to an I/Q mixer is on the
list, and amounts to the same thing as a DSP R2...

I just implemented LMS adaptive filtering for one of my courses
at school, and plan to port that to the ADSP-2181 as well.

I don't know what that goop is either.

My inlaws had a defunct remote control for a TV set. I opened it up and found
all kinds of gunk inside. Cleaned it with rubbing alcohol and it worked fine.

Could be that moisture collects in there, along with bits of dust and other stuff.

I suppose they could be using some type of lubricant, but I don't know what. If it is nonconductive it could prevent a connection being made and if it is conductive it could short out something.

I have heard that Solid State Design is being rewriten even as we speak as
the current version is pretty dated. When the new version will be coming out
is open to speculation. Any one else heard this?

They *could* include a short appendix describing how to work around
the obsoleted semiconductors used throughout the book. Quite a few
of the projects described use parts that are simply unobtainable
these days. However, at $12 US, this is still one of the best books
a radio experimentor could have in a library.

No name on this critter, but it's big.
20 turns of heavy copper square stock form a winding that increases in turn spacing as it winds down the open form. Spacing at the extreme end is about 1/2" overall length of the coil form is 8" X 4" dia.
Overall size of support frame is 5 1/2" wide X 11 1/2" long X 6 1/2" tall. 3/8" drive shaft. VG condition, I've got a HB ant tuner that uses another one of these and it works great. $75 + ship for 10 # from VA 24012.
Also have a motor driven military gizmo with 2 large dia coils. As the geared motor drives them in either direction, a silver ribbon is spooled from one to the other//changeing the inductance by remote control. From a remote ant tuner??? 28V motor, works fine $45. 8# ship.
Thanks, Craig

I'm sure you're referring to Wes Hayward, W7ZOI, the co-author of
Solid State Design. He recently retired, so hopefully he'll have
more time to devote to writing a new edition.

You will find this "goo" in almost anything with rubber key pad. I belive it skin oil from human contact. Cleaning with alcohol or dish detergent will usually solve the problem. Clean both board and keypad, and allow to dry completely before reassembling. JCC

Hello Bob,

The URL is:

http://www.dejanews.com

The most useful tool is the "power search".

You can also get a free email address, and also access some newsgroups that AOL doesn't.

Good luck! If you don't have a dip meter, get one - or build one. I use an old Heathkit GD-1B that's nowhere near mint but does the job.

Any questions, just ask.

5310. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-12-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <742np2$fl4@news.Hawaii.Edu>
Source record: 76349
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6OO
(rec.radio.amateur working-group)

Help,
I have obtained a homebrew rig with the following :-

vfo output reads 11.000 to 11.300 mhz on 7-segment
display (adjustable)
display has on board xtal osc
4.000mhz xtal osc to both rx and tx
possible change to 7.0mhz band?
ne602s in rx have pins 4 & 7 not connected

Any ideas on what the set-up is would be appreciated. tnx

Try this link.

http://noname.cmpe.ubc.ca/pierre/hbradios.htm

It has the Herring Aid 5 and the Tuna Tin 2, which I believe are the
ones you want.

It also has a few links to items on Harry Lythall's (SM0VPO) Homebrew page,
which is worth a look (and you can find Harry's URL in any search engine)

No, I won't email it to you or to any other "me-to"ers. If you ask for
information on a newsgroup that is of interest to much of the newsgroup
users, expect to retrieve that information from the newsgroup.

>each band.

A combination approach will likely work best. The basic structure is a low
pass and a high pass, connected together at the antenna terminal. But that
may not offer enough isolation depending on the power level and the frequency
separation. Parallel tuned series elements and series tuned shunt elements
will likely be needed to achieve sufficient isolation. These can be incorporated
into the low pass and high pass filter structures by paralleling and shunting
elements of those filters. The Handbook has a design which may be used as
a guide. (They refer to it as a diplexer rather than a duplexer.)

But there was nothing particularly special about the design of these. The uniqueness came from being built into the tin cans leftover after you've eaten the contents. The idea wasn't to create a novelty radio, but to show ingenuity, and to show that you didn't have to buy an expensive metal box to build something in. These are important matters, since with the low cost of semiconductors you can build simple equipment for virtually nothing, but when it comes time to put it in a box, the cost rises dramatically. I'm sure one of the articles (there wsa the original transmitter, a receiver, and then a vfo) suggested that you simply visit the supermarket and look at the canned food items until you find a suitable case.

We need the following items in Quantities Of 1 TO 250: (PAID IN US FUNDS)

Pentium Pro 200-256k@512k CPUs (paying up to 150.00 & 220.00)
Pentium Pro 200-1 meg cache (paying up to 500.00)
Pentium 200 CPUs non mmx (paying up to 75.00)
Pentium Pro 166-512k (paying up to 75.00)
16mb and 32mb simms also 64mbs (paying 10.00 and 19.00)
Pentium 200 mmx and k6-233 (paying up to 50.00)
Hard drives 2.1gb-6.4gb new only (paying 50.00 to 110.00)
Floppy Drives 1.44 new w/face (paying up to 8.00)
Pcmcia modems 28.8 & 33.6 (paying 15.00 and 20.00)
Pentium Motherboards (paying up to 25.00)
Also looking any type memory in quantity email your list.
And all other excess computer products in quantities 1-500.
E-mail or call with your list.

Note: We only buy working products. New, used or refurbished
is fine. Software must be new and unopened with all certificates.

Computer Surplus Outlet is a Company engaged solely
in purchases of EXCESS COMPUTER INVENTORIES. We have
access to purchase any quantities or lots available.
We are not a broker. This is our only business and
expertise.

Our team of buyers are waiting to give you the highest
possible bid in the country. Response on the bid will
within 24 hours.

HOW IT WORKS:
After agreed upon price we will issue a Purchase order (PO#)
which must be on the outside of your box. You furnish your name
and address that you want the check mailed to. You allow up
to 3 days for receiving and testing of your products. Then your
check is mailed. In some case we will provide our Airborne
account # for the shipping and also will accept COD
in other instances. We make it EASY MONEY for YOU.

5321. Need Spec for Motorola MWA110 AMP

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-12-03 00:00:00 UTC
From: af389@lafn.ORG
Message-ID: <3665FF42.2C1AC2E0@lafn.org>
Source record: 76282

Hi Dan's Small Parts is offering for sale
the following:

Dan's page says:
"Motorola MWA110 Hybred Amplifier 3 PIN CAN(50 ohm)
This is a wideband RF/IF amplifier.
Frequency Range 0.1 Mhz - 400 Mhz"
==========
Dan says the detail specs are in 1995 ARRL Handbook.
I do not have that edition and cannot find specs on web.

Need 5 volts across 50 ohms, from 1mhz to 50 mhz (500 mw).
Can this AMP do this? IF not, can two or more be used
in parallel do the job?
If, not, what other low cost part can you suggest?

Having trouble making 2N5179 and 5109
do this over the full bandwidth.

Thanks for any help.
73, W6MIK

Source record: 76285

The MWA110 has 1 dB output compression at -2.5 dBm, so it's about
three orders of magnitude shy of your 500 mW requirement. You'd have
to parallel 1000 (theoretically) to get what you need.

The Motorola CA2810C or CA2818C would do the job, but I don't think
they're low cost by most standards.

> >
> >Any advise on how to produce very clean cuts?
> >
> >Rick, W1TY

I have cut a lot of Plexiglas of different thicknesses for various wood projects. The trouble with the 1/16" stuff is that it shatters very easily. I have had some success by sandwiching it between a couple pieces of scrap wood (like 1/8" hardboard, cuz it's cheap) and running it through the table saw. Alternatively, placing 2" masking tape on the cut line (if the protective coating has been removed) helps prevent some of the jagged edges. The most important thing, is to use a fine tooth blade. As the other couple posts read, both the scroll saw and band saw have fine blades, so the cut will be that much smoother. I don't have any 1/16" on hand, but if you wanna gimme your address, I can cut the 3 pieces from 1/8" for you. Hope this helps, 73 de VE6INM -- VE6INM (Glenn)

Motorola shows this part as being discontinued as of Q4 1998.
http://mot-sps.com/sps/General/chips-nav.html and poke around

Have you looked at Mini-Circuits MMICs? You should be able to parallel these
if needed for gain, and they're pretty cheap.

Does anyone have a circuit or source for same of an antenna distribution unit for H.F. frequencies, 1 in 4 out although 2 out will do. The unit needs to give sufficient isolation between sets so as to avoid problems from in built atu's, 75 ohm preferred.

"The Art of Electronics" by Horowitz and Hill. If you can only have one book, this is it. Otherwise, add "Introduction to Radio Frequency Design" by Wes Hayward, and a recent copy of The ARRL Handbook.

Hey David!

So, you're looking for a constant output level across a wide range; what is the characteristic of the input signal? Is it a single CW carrier (I don't mean Morse code ;-)) that varies slowly in frequency? If so, you may have more success using AGC to stablize the level.

Otherwise, building an amplifier with that much gain flatness across 6 octaves and +27dBm output probably means you'll have to use a much higher-powered device (+27dBm is a little much output for a 2N5109 anyway) with severe feedback. A 2N4427 is probably a better choice than the 2N5109 in this case, but I'm just guessing.

I once saw a design using a 2N5590 (at one time a very common VHF PA transistor) as a broadband amplifier, which probably was just sort of the thing you want.

The cat's meow for wideband power amplifier devices is almost certainly an RF power MOSFET. The MRF5003, for example, might be just the ticket, or perhaps there are even newer related devices. For example, my FT-847 uses an MRF5015 (big brother to the MRF5003) in the HF/6m PA, clearly a wide-band PA design.

For 1/16 inch the best way to make long straight cuts
is to first score it with a sharp knife,
clamp it to a table top with a board on top and
the score right on the edge of the table (top side), and break
it. Works very well. If you need 3/8 inch strips clamp
the 3/8 wide part and break the rest off. Might have to
use a piece of metal to clamp it for strips that thin.

Tap Plastics sells a scoring knife just for this purpose,
and may have furhter advice for your particular situation.

Dana OM,

Let me echo your thoughts: The SS Design book is the single best bargain around I think, for RF homebrewers. The devices are dated, but the concepts are not. I bought mine in the late 70's. Trouble is, I am afraid that any updated edition will be priced astronomically high like the new handbooks and such are. I have not purchased an ARRL handbook for many years, and have found little reason to do so. Perusal at the local library suffices.

73,
Don, W6JL

Jeff OM,

The most cost-effective way I can suggest is to visit your local
library. Any copy of the ARRL handbook, or introductory texts on
electronics will get you going, and save you money too.

Here's three ways...
1 - Table saw with 40T blade.
2 - Clamp the piece to straight edge and use a router.
3 - Score the piece, then snap on edge of table (There's a special knife thats used).
Then with you torch heat the cut edge a little to give it the glass look.

5341. Interference on HF, Any suggestions?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-12-03 00:00:00 UTC
From: Rick Miller <spamfree.rdmiller@bit-net.com>
Message-ID: <36673AE1.396C@bit-net.com>
Source record: 76302
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

For the past several weeks I have been observing interference
on the HF band. Here are some of my observations:

1) The interference sounds like raspy static.
2) The signal is several KHz wide.
3) It occurs ~ every 117 KHz.
4) I have tracked it as far down the HF spectrum as 1.9 MHz.
5) It tends to drift in frequency up and down the band.
6) It seems to be several S units louder than the background noise
level, but not a function of the background noise.
7) I have ovserved it on 2 different radios, with all other equipment
turned off (I think).
8) I have observed it outside the house with a loop antenna hooked
to my broadband scanner.
9) It seems always to be present. I have not turned the radio on when
I could not find it.

I suspect it may be leakage from the cable company, but they tell me
that if it were leakage, my TV picture would be degrade. I'm not
entirely sure I aggree with this. And I see evidence of work at 2 of
their polls at the edge of my property in the last few weeks.

Do the characteristics of this signal point to any particular service?
The main problem is that it disrupts my activity on 10 meters. I'm
located in central NH.

Any suggestions would be appreciated.

I'd try to find the S-parameters of the part. HP must have them in
their data books. Trying to guess at the input impedance seems like the
hard way to do it. I've only desiged on paper using a smith chart and
desingning striplne matching networks, but that would be easy to
translate to lumped components. I was given the S-parameters in all
cases, though. Also, you said nothing about the value of inductance
that the ferrite bead provides. Could it be that it's not enough? I
think a few turns of wire around the bead would be better. It couldn't
hurt!

Find a book on RF design. Or ruin your hobby by getting an EE degree,
like me!

Good Luck

I don't think this goo is supposed to be there. (I've had a bunch of these open & never seen that before) It doesn't take much contaminant to screw these things up.

I'd clean it with a Q-tip soaked with water or something. I'll bet that'll fix it.

> welcome, as I desparately need help. Thanks.

I don't have any data on that transistor in front of me, but its
stability factor, k is less than 1 at low frequencies. That means
you cannot use lossless matching to get a simultaneous
conjugate-match at both the input and output with that transistor
as-is. If you try, it will oscillate.

From the transistor S parameters, you can calculate and plot
input and output "stability circles" on a Smith Chart, for the
transistor over those frequencies where k<1. These are regions
of input and output impedances that will cause the transistor
to oscillate. You need to assure that the transistor will never
see those impedances, regardless of what loads are applied at
the far end of your I/O matching circuits.

One way to do this is to add a resistor somewhere in the
matching network. For example, if the region of instability
is <10 Ohms, you can put 10 Ohms in series, and assure the
transistor will always be stable. If the region of instability
is >500 Ohms, you can put 500 Ohms in shunt to assure stability.
If you're looking out-of-band, then you can make the
network so that the resistors do not affect in-band performance.
You can work with either the input or output stability.
As you make one stable, the other becomes stable also.

Another way to stabilize the amplifier is to modify the
S-parameters of the "transistor" by introducing feedback.

I'd look at biasing the transistor with RB1 from Vcc
to the base and RB2 from the base to ground. Design RB1
to carry 5 times the base current and RB2 4 times the base
current. Look to see if leaving the resistors in the
RF path helps stabilize it. If not use a bias choke.

The S-parameters should be available at HP's website.
I think there are some free analysis software tools
there too.

It doesn't sound like cable TV leakage. All their signals are much higher than the frequencies you are hearing the noise on your HF receiver. That part about the TV signal being degraded if the cable was leaking is baloney, though.

From what you describe, the noise could be any of a hundred types of common everyday equipment types. For starters, put your receiver on battery and turn off the MAIN breaker to your house. This should eliminate anything within. If outside the house, I suggest you equip yourself with a battery source on your 10 M rig and traverse the neighbor looking for where the signal may be strongest. Shorten or eliminate your antenna to keep the noise from saturating your receiver until you believe you are at the source. Can't offer much help at this point as you will probably be needing to knock on doors and go from there.

HINT, if the signal gets too strong, keep tuning higher in frequency, (your scanner perhaps) to use the highest frequency you can hear it at as your source to locate.

Hello Folks:

I have a low-power FM broadcast transmitter in service in Canada which operates on 106.3 Mhz in support of short-term Special Events. See our site at:

http://www.mts.net/~ckvnfm

I would like to be able to control the tx from our remote location, and DTMF tones down the broadcast line is the way I have selected to do the job. Here's where I need your help in recommending a kit or inexpensive assembled unit that has worked well for you.

As far as functions, it is quite simple....control a latching relay so that one set of tones turns it on, and another set turns it off. Bear in mind that it will bridge the audio programming, so it would have to be impervious to the regular audio pramming sent down the line...after all, I don't want some music passages tripping the tx off!

Thanks in advance for taking the time to point me in the right direction, based on your experience.

Please reply to me directly via email at:

AT-31625 - what freq is it designed to run at - I don't have databooks
to hand but is this not designed for 1-2Ghz operation? I might be
wrong on this.

If it is then it is likely to be only conditionally stable at lower
(higher gain) freqs. The databook s-parameters allow you to calculate
this. If it is only conditionally stable you won't get 50 ohm on
inpuit and output simultaneously.

I've seen the "goo" recently in 2 remotes. Can't imagine how it could have gotten in there other than having been put there deliberately by the manufacturer. I wiped it off the contact traces only, polished them up with a pencil eraser, left the goo on the membrane, closed up the cases and they worked like new.

Hello--

My ongoing sale of Rogers Duroid microwave-grade printed-circuit board laminate continues, but both stacks are getting shorter (the double-sided material is currently outselling the single-sided). My thanks go to everyone who has purchased from me!

73,
Brad AA1IP

****

Rogers RT/duroid 5880 microwave-grade printed-circuit laminate for sale: consists of two layers of 0.5-ounce rolled copper foil bonded onto a 0.031-inch core of glass microfiber-reinforced Teflon (tm) dielectric. A layer of transparent peelable plastic film protects each copper surface, rendering the copper shiny and probably ready to etch as-is.

Each board carries a Rogers label and measures 8.125 inches by 12.125 inches. Detailed specifications are available at the Rogers web site: http://www.rogers-corp.com

Dielectric constant K= 2.20 (typical)+/- 0.02
Dissipation factor at 10 GHz (tan delta)= 0.0009

Price: $10.00 per piece; or $20.00 for three pieces, plus $3.75 for insured priority-mail shipment (U.S. only). Canadian purchasers, please inquire for postage.

***

Also available: Rogers RT/duroid 5870 microwave-grade SINGLE_SIDED printed-circuit laminate: one layer of 0.5-ounce rolled copper foil bonded onto a 0.031-inch core of glass microfiber-reinforced Teflon (tm) dielectric. A layer of transparent peelable plastic film protects the copper surface, rendering the copper shiny and probably ready to etch as-is. Each board carries a Rogers label and measures 8 inches by 9 inches.

Price: $5.00 per piece; or $10.00 for three pieces, plus $3.75 for insured priority-mail shipment (U.S. only). Canadian purchasers, please inquire for postage.
***
Shipment restrictions:

Please note: this material is for sale to Canadian and U.S. purchasers only. Foreign shipments of unfabricated RT/duroid require an export license and may be subject to shipping restrictions.

I accept payment via personal or cashier's check or money order drawn in U.S. dollars and made payable to "Brad Thompson".

Warranty policy:

If you purchase these boards and find them unsatisfactory upon your visual inspection, you can return your unused boards in as-received condition for a full refund within seven days.

This material is subject to prior sale and is supplied as-is, as new-old-stock (NOS) merchandise, with all responsibility for safe and successful application residing solely with the purchaser.

It could possibly be a TV set in your house or re-radiating from a neighbors
TV antenna. It could also be a defective TV amplifier in your/neighbors
house. And of course the cable system could be generating noise not only
from the actual TV signal, but from their switchable power supplies.

Likely problems with CATV is improperly grounded and/or terminated ports.
Sometimes the crews do not instal the terminating plugs at the amp's. This

allows leakage. And of course the F connectors are bad for poor ground connections.

Recently picked up a defunct all band ,digital readout, tabletop short wave receiver at a swapfest. This unit was made by Radio Shack in the early eighties and has triple conversion; model # is Dx-300, and the old catalog # 20-204. It didn't take to long to find the physical problem, but the alignment of the radio is totally off.

I have tried to get the service manual from RS, but am the proud owner of two user manuals instead. They now say there isn't a service manual available anymore. Ideas anyone? It looks like someone turned every pot, cap, and core in this radio! I tried counting all the adjustments, but quit after 14 bazillion.

HHHHHelp! Any suggestions appreciated.

The "Goo" is a combination of water vapor (humidity) from human contact,
airborne dust and solublized plasticizer from the membrane itself.
Remove using isopropanol or other contact cleaner. I've done this
numerous times on an ATT 9100 phone and kept it fully functional for
years.

Just what kind is it? I have one that I got from my university some
time ago, but I don't know if it would meet your specs:
Heathkit electronic design experimenter
+/- power suppplies, 1 to 15V
Also 15 and 30VAC
frequency generator---~200Hz-20kHz, sine and square wave
1k pot
10k pot
small prototype board

I haven't taken the time to test it to see if it works, so I don't know
of it's condition, other than it looks like it is altogether. It's
painted with some sort of floresent orange and written on (EE UMO, that
sort of thing, to prevent it's theft). Let me know if this is something
that you are looking for.

From: "George J. Molnar" <George@Molnar.com>
Message-ID: <3668472E.54771C5B@Molnar.com>
Source record: 76226

Hi folks...

Is there anyone out there with an IC-706 (original version) service manual that would be willing to copy (scan) the pictorial of the filter board and e-mail it to me? Or describe really well the locations of Q-1 and D-18. Judging from my problems, and Icom's tech support recommendations, I need to replace both. Looking at the board, I cannot see any semiconductors labeled! Whoops...

If anyone has a 706 MkII(G optional) that they would like to trade for an original 706, I'll pay shipping both ways <g>...

> Is there any proper procedure to tune a RF transistor?

Well, I saw some other responses that are correct as far as they go, but
don't mention clearly the basic problem, which is that all transistors
have an inherent feedback path inside, and at radio frequencies this
matters a lot. You may notice that s21 is finite, which indicates that
feedback exists.

There are two ways of making your amplifier stable:

- sacrifice gain by mismatching at input or output or both. That seems
to be the current trend, judging by other responses.

- provide an external feedback path that feeds back a signal equal in
amplitude but opposite (or nearly) in phase to that coming through the
internal feedback. If you do this with only approximately the correct
phase, it is called 'neutralization'. If you take steps to get the phase
right as well, then it is 'unilateralization', and this is usually too
much trouble to get right. Neutralization, however, used to be quite
coomon. It is a very old technique, first invented to stabilise triode
tube r.f. amplifiers with a reasonable stage gain. If you use it, you
will be able to get much more gain from your transistor than in the
'mismatch' case, at the expense of (maybe only a litte) extra circuitry.

For details, see any good r.f. textbook from say 20 years ago. It's
practicable at 150-170 MHz: not so practicable at much higher
frequencies because you often need very small capacitance values
(femtofarads, maybe).

> What
>should I be doing on base bias network in order to connect it to 5V
>instead of a separate power supply for Vbb? Is a voltage divider
>okay, or should I have something fancy?

Divider should be OK. Attend to decoupling it properly: you don't want
any r.f. getting back into the input circuit through that route!

>Is there any rule of thumb in
>adjusting things to tune a RF transistor?

Well, yes. But it is more or less textbook stuff. For a 'neuted' stage,
tune the output, tune the input until it oscillates, tweak the neuting
to stop it oscillating, tweak the output tuning, tweak the input
tuning....until you get tired, or the response shape and gain look OK on
the sweep generator....

During many years as a factory service tech for Sony of Canada, I had the opportunity to work on many remotes and keyboard control devices, new and used. They are not supplied with any goo -- it seems to migrate there after considerable handling by users. When replacing the rubber membrane we cleaned any foreign matter from the remote and the membrane before reassembling the unit.

A better method of biasing an RF grounded emitter device is to use a cheap
low frequency PNP as a current source into the NPN's base. Obtain feedback
for the current source from the NPN's collector current.

```
_______Vcc
| |
| R
| |---------- bypass
R |/ |
-----| pnp )
R |\ ( collector feed (coil, choke, res)
| | )
g R |-------->
| |/
>-----*-----| npn
|\
|
g
```

Also bypass the pnp base. Temperature compensation may be added with a
diode in the resistive divider setting up the pnp base voltage.
(I hate ASCII schem's, g=gnd R=res)

Hi,

Thank you very much for all of you who replied to my post regarding tuning a RF transistor. Let me give you an update and some other questions.
I tried the s-parameter method together with real measurement and smith-chart, and finally got the transistor tuned to match input closed to 50ohm. However, it is difficult to tune the output. I have a LC circuit at the input (base -> series coil -> shunt cap -> coupling cap -> input) and a pi-network at the output (collector -> shunt cap -> series coil -> shunt cap -> coupling cap -> output). I could increase the value of the shunt cap closed to the collector to lower s11, but then it increased s22. Then I increased the shunt cap closed to the output, it can lower s22, but then the input get mistuned. At last I decided to tune the input for 50ohm match and let the output mis-tune a little bit, which can be compensated by tuning the antenna or TX/RX switch.
Another question I came across when tuning is: I have to increase the bias voltage to get the transistor well tuned. Right now I have a resistor divider network like this:

```
Vbb (set at around 3.5V)
|
1k
|
o--1k--FerriteBead(coated wires wrap around a ferrite ring)--51ohm--Base
|
1k
|
GND
```

I can increase the bias to set base voltage at around 0.69V. When I have a +5dBm signal at the input, the transistor outputs +25dBm (which is what I want) at Icc=170mA. However, when I remove the input signal and put a 50ohm termination, Icc raises to 230mA. Is that normal? What have I done to make it operate this way? Am I driving the transistor too hard? Thanks.

Artur

I second that. The education greatly enhanced the hobby for me. It gave me the tools to understand a lot more of what I was doing and about the things I'm interested in. I got my degree 17 years after first becoming a ham, and I've been a ham for the 24 years since. I get a chuckle out of the "engineers vs hams" comments I occasionally see -- I'm most definitely both!

I bought at a surplus store a few what I thought were ELECTROLYTICS and which were mixed in with other electrolytics. The lighting is never very good in those metal warehouse type buildings and I read the value but didn't pay other attention to them. However when I went to solder them into a boat anchor radio to replace an old paper electrolytic I couldn't find a polarity on them

No problem, I thought, I'll put them on my Heath capacitor checker, see which polarity gives the right value and if that doesn't do it, I'll see which direction appears to be shorted or leaky.

The darned things seem to check the same in EITHER direction and the radio works fine with it soldered in randomly. Of course the radio worked fine with the old electrolytic which was so leaky that I couldn't get a measurement of it.

The package is axial and the end caps on them are both insulating, black and both end disks have a small depressed circle next to the lead so the ends are identical. The case is an "electric" blue and the case crimping appears to be identical on either end.

The capacitors have on them a stylized sloping IC with a circled R as a superscript at the end. They are 50V, 10 Mfd units. The other lettering on the case is: BPAM above (J)85 (deg)C and below that 18.

Can anybody identify these? Unpolarized high capacitance caps??? I've never encountered them before.

Ian, K6SDE

I forgot to mention in what regard it's 'better'. That being, it is not
highly dependant on your NPN Bf or Is. In production the simple divider
will produce a wide range of currents with lot to lot device tolerances.

I'm in Montreal, not Winnipeg, so I can't offer any direct information.

But you might find some local ham clubs at the Radio Amateur's of Canada site at http://www.rac.ca It also has a list of places where you can buy the RAC study guides and if there's a ham store in Winnipeg, it should show up there. hey also have a listing of upcoming hamfests, though I'm not sure there'd be anything around Christmas.

The local newsgroup is wpg.general Whether you'd find any Winnipeg hams by posting to that newsgroup is uncertain, but it might be a place to find some things about the city in general. I think the Manitoba-wise newsgroup is man.general but I don't see it here. I think the man.* hierarchy has some policy against out of province posting, though my recollection may be wrong.

I haven't been watching the weather in Manitoba, but here in Montreal we've had quite warm wether so far.

I'd like to use some cookbook circuits (borrowed from the excellent receiver articles over the last 20 plus years) to assemble a 20, 15, and 10 meter MOBILE transceiver. One area causing much head-scratching is noise blanker circuitry. Most conversations indicate that noise blankers are in the domain of voodoo/outside mysterious forces. Other gurus say not to use a NB at all. Well, I need to learn, but without building dozens of circuits. The IF uses AD 602's and I plan to operate both CW and SSB, with home-brew ladder filters. Any comments or references would be helpful.

I'm getting something here (Seattle) in a slightly different form, (same timing though, so it makes me think it's the same stuff). It adds a tinkle like sound to the weaker shortwave broadcasts, which I interpet as the beat from a high speed FM signal. Judging by the way it beats with fixed signals, there's a comb spectrum of signals. About every 10 kHz, but not exactly, as the tone of the beat with the other signals shifts as you tune across the band. The modulation seems to be in the 5-10 Hz range.

My guess is that it's a new over the horizon radar. The return of The Woodpecker in a slightly less obnoxious form.

5381. HELP! RF Transistor Tuning

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-12-04 00:00:00 UTC

Hi,

I desparately need help from folks on this NG on tuning RF transistor. I am trying to tune a Hewlett-Packard AT-31625 to operate at 150-170MHz with about +27dBm (500mW) of output power and Vcc=5V. Right now there is a ferrite-bead and a 10ohm resistor in the collector circuit (collector, 10ohm, FB, then Vcc). In the bias circuit -- (base, 470ohm, FB, then Vbb). Emitter is connected directly to ground. This configuration allows me to directly hook up Vbb to power supply to vary the bias voltage.
I tried to measure the s-parameters without any input/output matching network but just coupling caps (470pF) at the base and collector. Then I started the tuning process. I started to tune the input to 50ohm, then tune the output. However, when I got the output properly tuned, input started to oscillate (with positive s11). When I could fix the oscillation problem, the input/output is mismatched again. Besides tuning, I could also vary the bias voltage..... so at this point I have too many things to tune at the same time and I am stuck.
Is there any proper procedure to tune a RF transistor? What should I be doing on base bias network in order to connect it to 5V instead of a separate power supply for Vbb? Is a voltage divider okay, or should I have something fancy? Is there any rule of thumb in adjusting things to tune a RF transistor? Any input is certainly welcome, as I desparately need help. Thanks.

hi all, looking for some coil stock, aprox. 3" to 4" dia. 6 turns per in. + or - and 6 to 10 guage wire. also would be interested in coils of similar size made of solid ribbon or tubbing. please let me know what you have and how much you want.
thanks & 73.....george

Back in pulse-dialing days (1975), I built one for my college department's
graduate-student phone to restrict out-going long-distance calls. I used
a KIM-1 single-board microcomputer (6502 MPU and one kilobyte of RAM) with
an opto-isolator across the phone line into an input port and monitored
(basically counted) pulses. If the first digit was "1", I broke the phone
line if the next three digits were NOT "800".

Worked like a charm for years.
